

# **SSD1803A**

## *Advance Information*

### **100 x 34 STN LCD Segment / Common Mono Driver with Controller**

This document contains information on a new product. Specifications and information herein are subject to change without notice.

**Appendix: IC Revision history of SSD1803A Specification**

<b>Version</b>	<b>Change Items</b>	<b>Effective Date</b>
1.0	1 <sup>st</sup> Release	17-Aug-10
2.0	P.40 Added ROM selection command P.50 Added ROM selection command description	17-Jun-11

## CONTENTS

<b>1</b>	<b>GENERAL DESCRIPTION .....</b>	<b>7</b>
<b>2</b>	<b>FEATURES.....</b>	<b>7</b>
<b>3</b>	<b>ORDERING INFORMATION .....</b>	<b>8</b>
<b>4</b>	<b>BLOCK DIAGRAM .....</b>	<b>9</b>
<b>5</b>	<b>DIE PAD FLOOR PLAN .....</b>	<b>10</b>
<b>6</b>	<b>PIN DESCRIPTIONS .....</b>	<b>14</b>
<b>7</b>	<b>FUNCTIONAL BLOCK DESCRIPTIONS.....</b>	<b>18</b>
7.1	BUSY FLAG (BF) .....	18
7.2	DISPLAY DATA RAM (DDRAM) .....	18
7.3	TIMING GENERATION CIRCUIT .....	22
7.4	ADDRESS COUNTER (AC).....	22
7.5	CURSOR/BLINK CONTROL CIRCUIT .....	22
7.6	LCD DRIVER CIRCUIT .....	22
7.7	CGROM (CHARACTER GENERATOR ROM) .....	23
7.8	CGRAM (CHARACTER GENERATOR RAM) .....	23
7.9	SEGRAM (SEGMENT ICON RAM) .....	25
7.10	SYSTEM INTERFACE.....	26
7.10.1	4-bit bus and 8-bit bus interface (IM2=H, IM1 = H) .....	26
7.10.2	Serial interface (IM2=L, IM1 = H) .....	27
7.10.3	I2C interface .....	29
7.11	5V IO REGULATOR .....	33
7.12	LCD DRIVING VOLTAGE GENERATOR AND REGULATOR .....	34
7.12.1	External VLCD mode.....	34
7.12.2	Internal voltage mode .....	35
7.13	OSCILLATOR CIRCUIT .....	37
<b>8</b>	<b>COMMAND TABLE .....</b>	<b>38</b>
<b>9</b>	<b>COMMAND DESCRIPTIONS.....</b>	<b>41</b>
9.1	CLEAR DISPLAY.....	41
9.2	RETURN HOME (RE = 0) .....	41
9.3	POWER DOWN MODE SET (RE = 1).....	41
9.4	ENTRY MODE SET .....	42
9.5	DISPLAY ON/OFF CONTROL (RE = 0).....	42
9.6	EXTENDED FUNCTION SET (RE = 1) .....	43
9.7	CURSOR OR DISPLAY SHIFT / BIAS RATIO SELECT (IS = 0, RE = 0) .....	43
9.8	DOUBLE HEIGHT(4-LINE)/ BIAS/ DISPLAY-DOT SHIFT (IS = 0, RE = 1).....	44
9.9	INTERNAL DIVIDER / OSC FREQUENCY (IS = 1, RE = 0).....	45
9.10	SHIFT/SCROLL ENABLE (IS =1, RE = 1).....	45
9.11	FUNCTION SET .....	46
9.12	SET CGRAM ADDRESS (IS = 0, RE = 0).....	47
9.13	SET SEGRAM ADDRESS (IS = 1, RE = 0).....	47
9.14	POWER/ ICON CONTROL/ CONTRAST SET (IS = 1, RE = 0).....	47
9.15	FOLLOWER CONTROL (IS = 1, RE = 0).....	48
9.16	CONTRAST SET (IS = 1, RE = 0).....	48
9.17	SET DDRAM ADDRESS (RE = 0).....	48
9.18	SET SCROLL QUANTITY (RE = 1).....	49
9.19	READ BUSY FLAG & ADDRESS .....	49
9.20	WRITE DATA TO RAM .....	50

9.21	READ DATA FROM RAM .....	50
9.22	EXTENDED INSTRUCTION SET .....	50
<b>10</b>	<b>MAXIMUM RATINGS .....</b>	<b>51</b>
<b>11</b>	<b>DC CHARACTERISTICS .....</b>	<b>52</b>
<b>12</b>	<b>AC CHARACTERISTICS .....</b>	<b>53</b>
12.1	CPU INTERFACE TIMING .....	54
12.1.1	<i>Parallel 6800-series Interface Timing</i> .....	54
<b>13</b>	<b>APPLICATION EXAMPLES .....</b>	<b>57</b>
13.1	APPLICATION EXAMPLE I (I2C INTERFACE, 3-LINE DISPLAY, 3V VDDIO MODE) .....	57
13.2	APPLICATION EXAMPLE II (4-LINE DISPLAY, 5V IO MODE) .....	59
13.3	INITIALIZATION.....	61
13.4	POWER ON/OFF SEQUENCE & VOUT TIMING.....	62
<b>14</b>	<b>PACKAGE INFORMATION.....</b>	<b>65</b>
14.1	DIE TRAY DIMENSIONS .....	65
<b>15</b>	<b>SSD1803AM1 CGROM CHARACTER CODE .....</b>	<b>66</b>
15.1	ROM A.....	66
15.2	ROM B.....	67
15.3	ROM C.....	68

## TABLES

## 5 DIE PAD FLOOR PLAN

Figure 5-1: SSD1803A Die Pad Floor Plan

### Note

- (1) Diagram showing the die face up, input on left hand side, output on right hand side.
- (2) Coordinates are referenced to center of the chip.
- (3) Coordinate units and size of all alignment marks are in um.
- (4) All alignment keys do not contain gold bump.

Die Size (after sawing)	4264 ± 50um X 1042 ± 50um
Die Thickness	300 ± 25 um
Typical Bump Height	12 um
Bump Co-planarity (within die)	≤3 um

Note: IC material temperature expansion factor is 2.6ppm,  
Customers should take into account during panel design.

Table 5-1: SSD1803A Bump Die Pad Coordinates (Bump center)

## 6 PIN DESCRIPTIONS

### Key:

I = Input  
 O =Output  
 IO = Bi-directional (input/output)  
 P = Power pin  
 GND = System Ground

**Table 6-1: Power Supply Pin Description**

Pin Name	Type	Connect To	When Not in Use	Description
VCI	P	[Low Voltage I/O App.] System Supply, shorts VDD= 2.4-3.6V [5V I/O App.] shorts VDD	-	This pin is the input of the voltage converter to generate LCD drive voltage. In Low Voltage I/O application (VDDREG pulled low), it should be shorted with VDD. In 5V I/O application (VDDREG pulled high), this pin should be shorted with VDD.
VDD	P	[Low Voltage I/O App.] System Supply, shorts VCI= 2.4-3.6V [5V I/O App.] Stabilizing Capacitor	-	This pin is the power supply for logic circuit (VDD should rise within 10ms). In 3V IO application (VDDREG pulled low), this is a power input pin. In 5V IO application (VDDREG pulled high), this pin outputs 3V and should be connected with a capacitor to VSS.
VDDIO	P	[Low Voltage I/O App.] System Supply, 2.4 – VCI [5V I/O App.] System Supply, 4.5 – 5.5V	-	This pin is the power supply for bus IO buffer in both Low Voltage I/O and 5V I/O application.
VSS1	GND	Ground of Power Supply	-	System ground pin of the IC for digital part
VSS2	GND	Ground of Power Supply	-	System ground pin of the IC for analog part

**Table 6-2 : LCD Driver Supply Pin Description**

Pin Name	Type	Connect To	When Not in Use	Description
VOUT	O	Stabilizing Capacitor	Open	Output of the voltage converter
V0	IO	Stabilizing Capacitor	Open	Regulated voltage from voltage converter for LCD driving
V1 –V4	IO	Stabilizing Capacitors (Optional for 1-line, 2-line or low loading applications)	Open	Bias voltage levels for LCD driving

**Table 6-3 : System Control Pin Description**

Pin Name	Type	Connect To	When Not in Use	Description

H	H	256	0																					
L	H	248	8																					
H	L	250	6																					
L	L	240	8																					

Pin Name	Type	Connect To	When Not in Use	Description		
ROM2, ROM1	I	VDDIO or VSS	-	This pin is used to select Character ROM:		
				ROM2	ROM1	ROM
				L	L	A
				L	H	B
				H	L	C
H	H	Invalid				
SHLC	I	VDDIO or VSS	-	This pin is used to select common signal directions:		
				SHLC	Direction	
				H	Com1 to Com32(Normal)	
L	Com32 to Com1 (Reverse)					
SHLS	I	VDDIO or VSS	-	This pin is used to select segment signal directions:		
				SHLS	Direction	
				H	Seg 1 to Seg 100 (Normal)	
L	Seg 100 to Seg 1 (Reverse)					

**Table 6-4 : MCU Interface Pin Description**

Pin Name	Type	Connect To	When Not in Use	Description	
RW	I	MCU	VDDIO or VSS	This pin is used to select read/ write operation in bus mode:	
				RW	Operation
				H	Read operation
				L	Write operation
E	I	MCU	VDDIO or VSS	This pin is used as read/write enable signal in bus mode.	
/CS	I	MCU	VDDIO or VSS	This pin is used as chip select in bus and serial mode.	
				CS	Selection
				H	Not selected
L	Selected				
RS/ SA0	I	MCU/ VDDIO or VSS	VDDIO or VSS	This pin is used as register select in bus mode:	
				RS	Register
				H	Data register
				L	Instruction register
				This pin is to define slave address in I2C mode.	
SA0	I2C address				
H	011 1101				
L	011 1100				
DB0/ SCLK/ SCL	IO	MCU	-	This pin is used as lowest bi-direction data bit in 8-bit bus mode, no signal input is needed during 4-bit bus mode.	
				This pin is used as serial clock input pin in serial mode.	
				This pin is used as clock input pin in I2C mode.	

Pin Name	Type	Connect To	When Not in Use	Description
DB1/ SID/ SDAin	IO	MCU	-	This pin is used as second lowest bi-direction data bit in 8-bit bus mode, no signal input is needed during 4-bit bus mode. This pin is used as serial data input pin in serial mode. This pin is used as data input pin in I2C mode.
DB2/ SOD/ SDAout	IO	MCU	-	This pin is used as third lowest bi-direction data bit in 8-bit bus mode, no signal input is needed during 4-bit bus mode. This pin is used as serial data output pin in serial mode. This pin is used as data/ acknowledge response output pin in I2C mode.
DB3	IO	MCU	VDDIO or VSS	This pin is used as forth lowest bi-direction data bit in 8-bit bus mode, no signal input is needed during 4-bit bus mode. During serial mode/ I2C mode, short these pins to VDDIO or VSS.
DB4 – DB7	IO	MCU	VDDIO or VSS	When in 8-bit bus mode, used as high order bi-directional data bus. In case of 4-bit bus mode, used as both high and low order. DB7 used for busy flag output. During serial mode/ I2C mode, short these pins to VDDIO or VSS.
RESET	I	Reset Pin	-	System reset pin
TESTA, TESTD, TEST0 – TEST7	-	-	-	These pins are reserved for test purpose. Nothing should be connected to these pins, nor are they connected together.

**Table 6-5 : LCD Driver Output Pin Description**

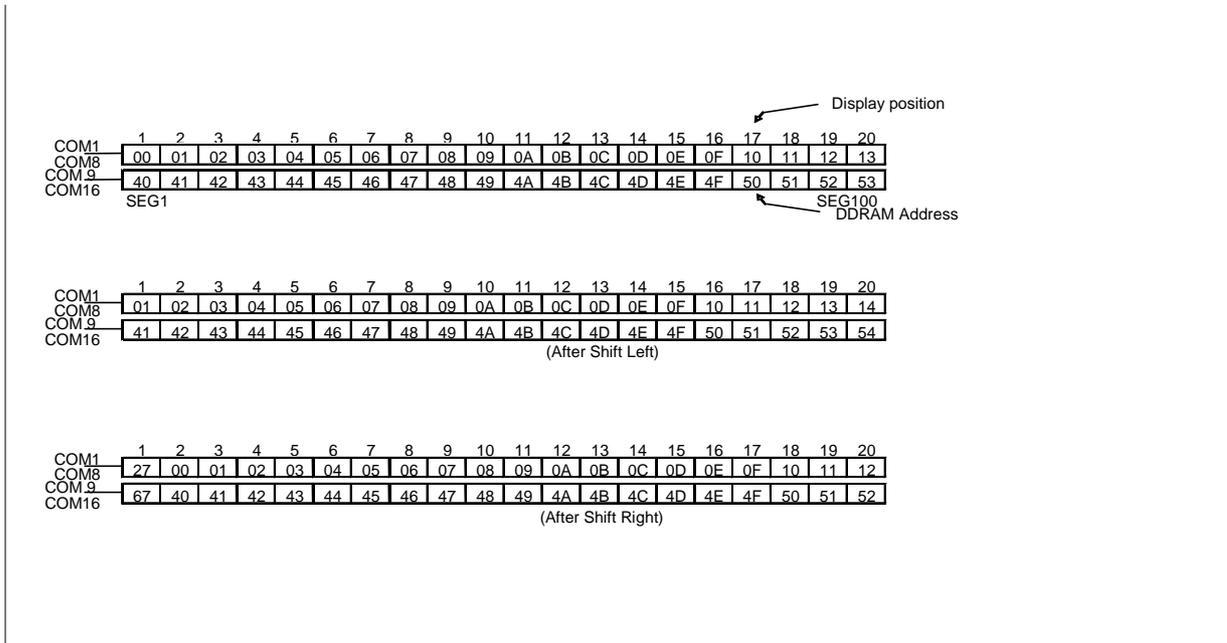

Pin Name	Type	Connect To	When Not in Use	Description
SEG1 - SEG100	O	Segment Output	Open	Segment signal outputs for LCD drive
ICON1, ICON2	O	Common Output	Open	Both ICON1 and ICON2 provide same output for ICON drive
COM1 - COM32	O	Common Output	Open	Common signal outputs for LCD drive

### 5-dot 2-line Display

In case of 2-line display with 5-dot font, the address range of DDRAM is 00H-27H, 40H-67H (refer to Figure 7-3).

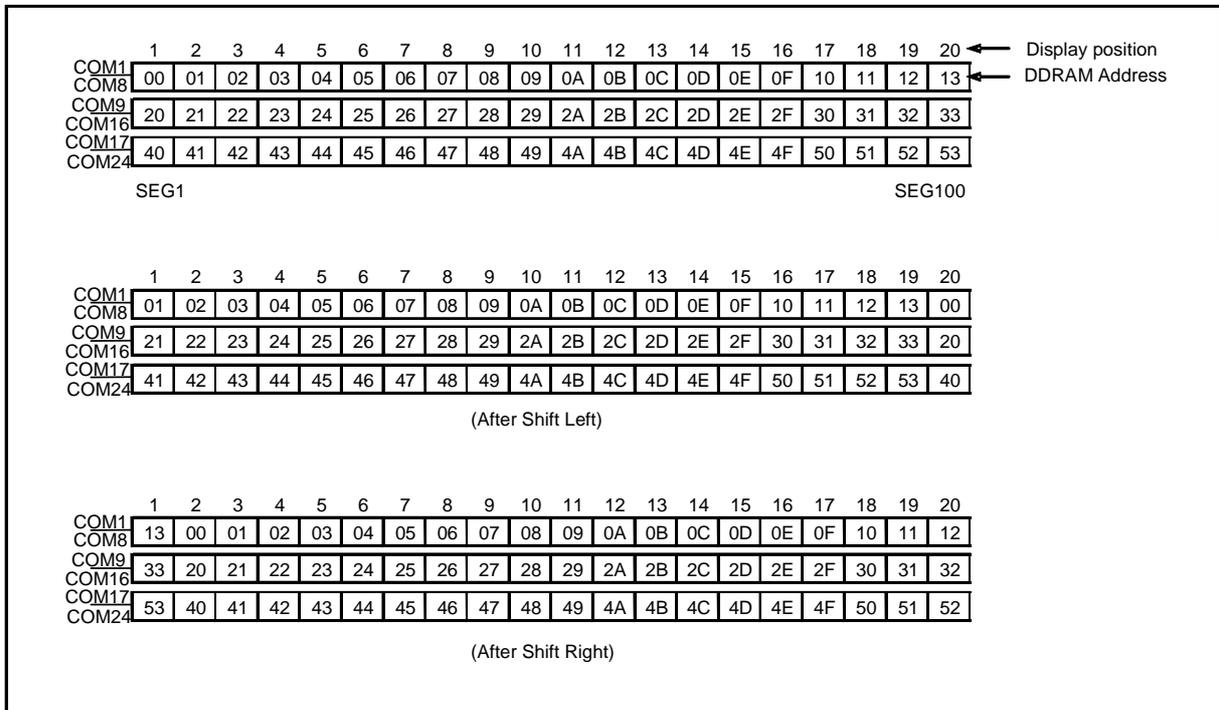

**Figure 7-3: 2-line x 20ch. Display (5-dot Font Width)**

### 5-dot 3-line Display

In case of 3-line display with 5-dot font, the address range of DDRAM is 00H-13H, 20H-33H, 40H-53H (refer to Figure 7-4).

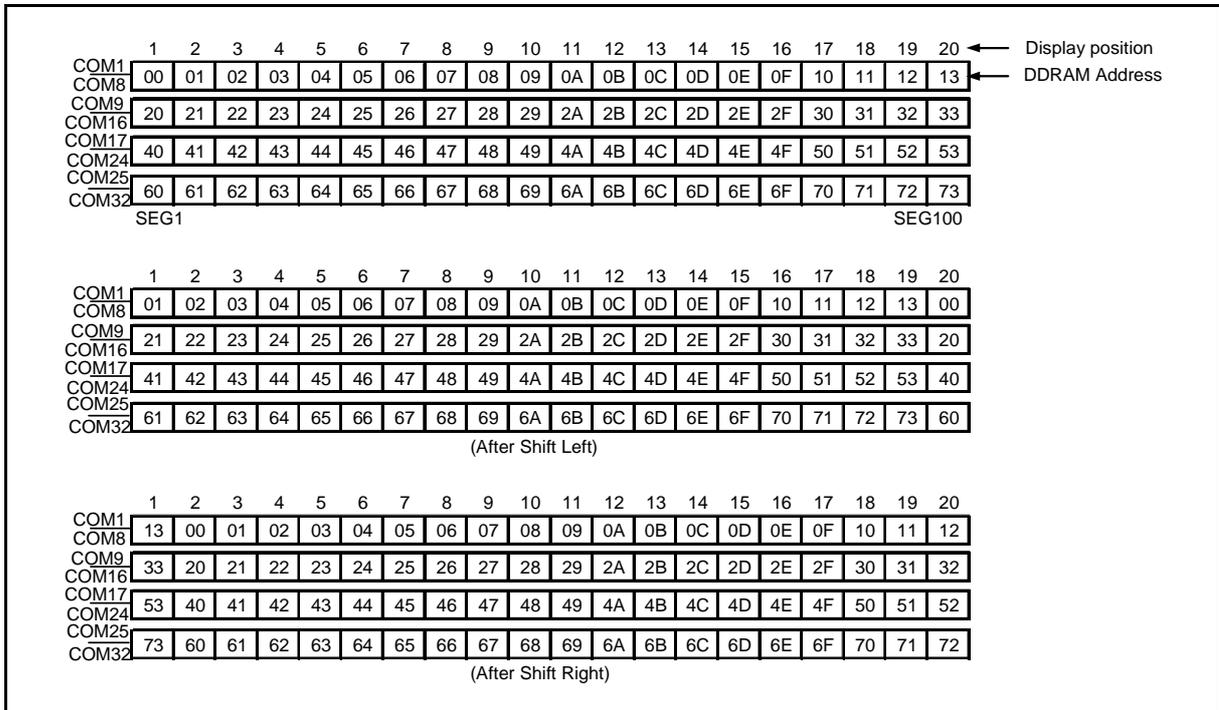

**Figure 7-4: 3-line x 20ch. Display (5-dot Font Width)**

### 5-dot 4-line Display

In case of 4-line display with 5-dot font, the address range of DDARM is 00H-13H, 20H-33H, 40H-53H, 60H-73H (refer to Figure 7-5).

**Figure 7-5: 4-line x 20ch. Display (5-dot Font Width)**

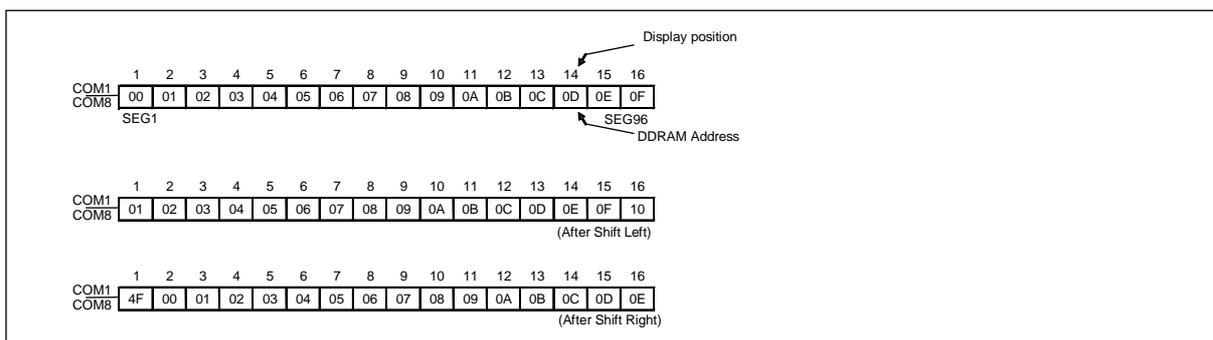

### DISPLAY OF 6-DOT FONT WIDTH CHARACTER

When the device is used in 6-dot font width mode, SEG97, SEG98, SEG99 and SEG100 must be opened.

### 6-dot 1-line Display

In case of 1-line display with 6-dot font, the address range of DDRAM is 00H-4FH (refer to Figure 7-6).

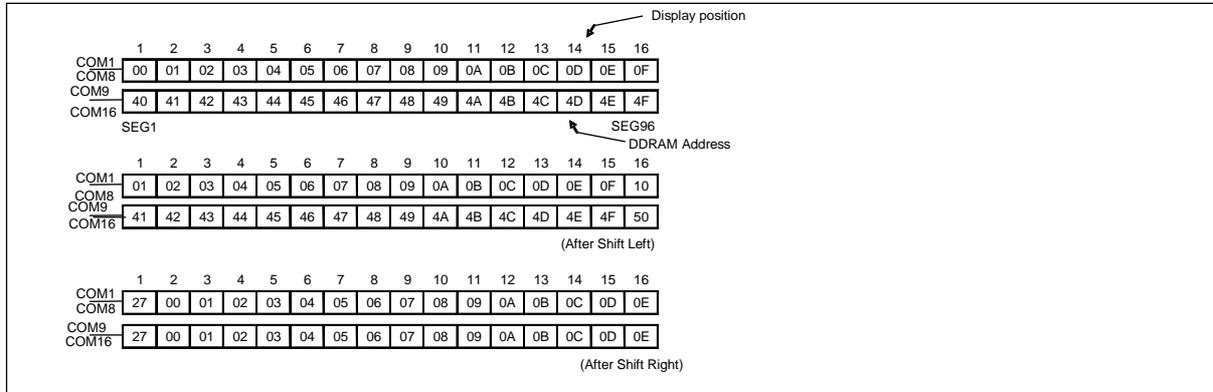

**Figure 7-6: 1-line x 16ch. Display (6-dot Font Width)**

### 6-dot 2-line Display

In case of 2-line display with 6-dot font, the address range of DDRAM is 00H-27H, 40H-67H (refer to Figure 7-7).

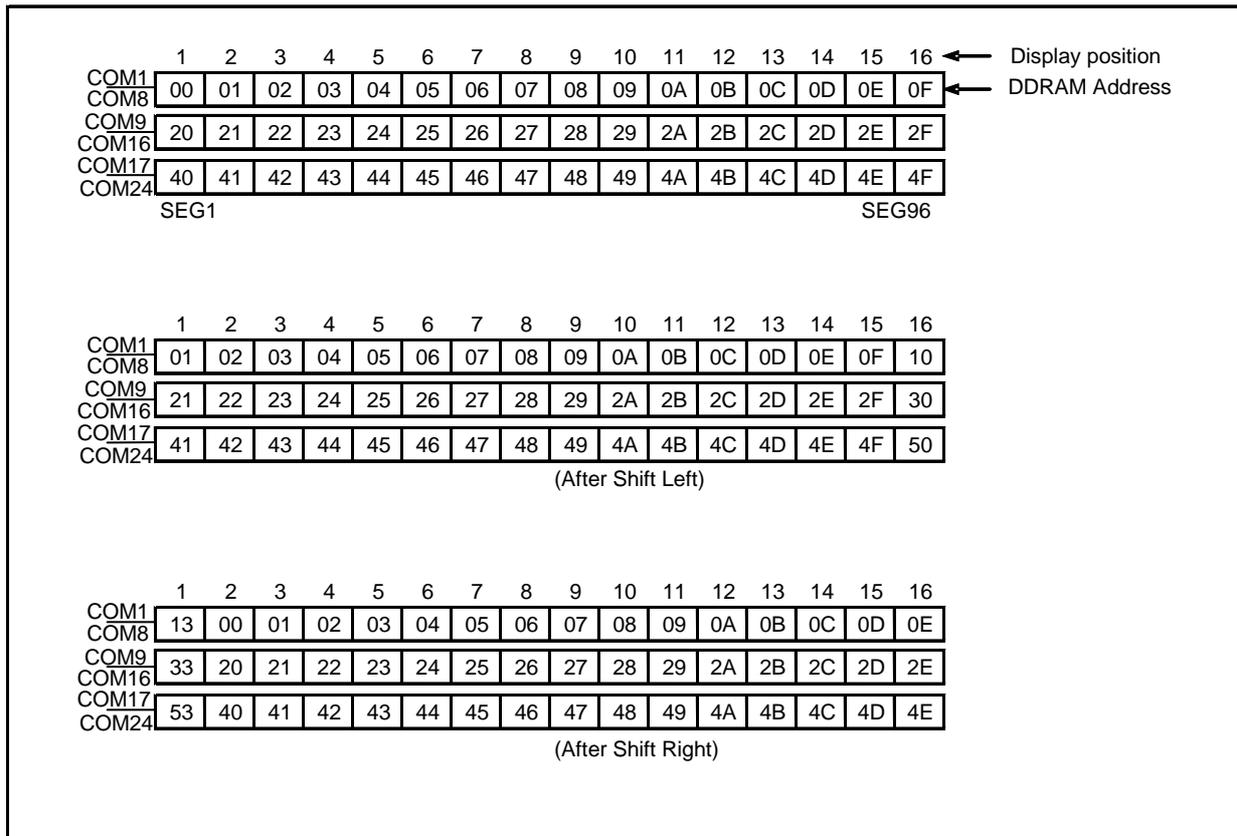

**Figure 7-7: 2-line x 16ch. Display (6-dot Font Width)**

### 6-dot 3-line Display

In case of 3-line display with 6-dot font, the address range of DDARM is 00H-13H, 20H-33H, 40H-53H (refer to Figure 7-8).

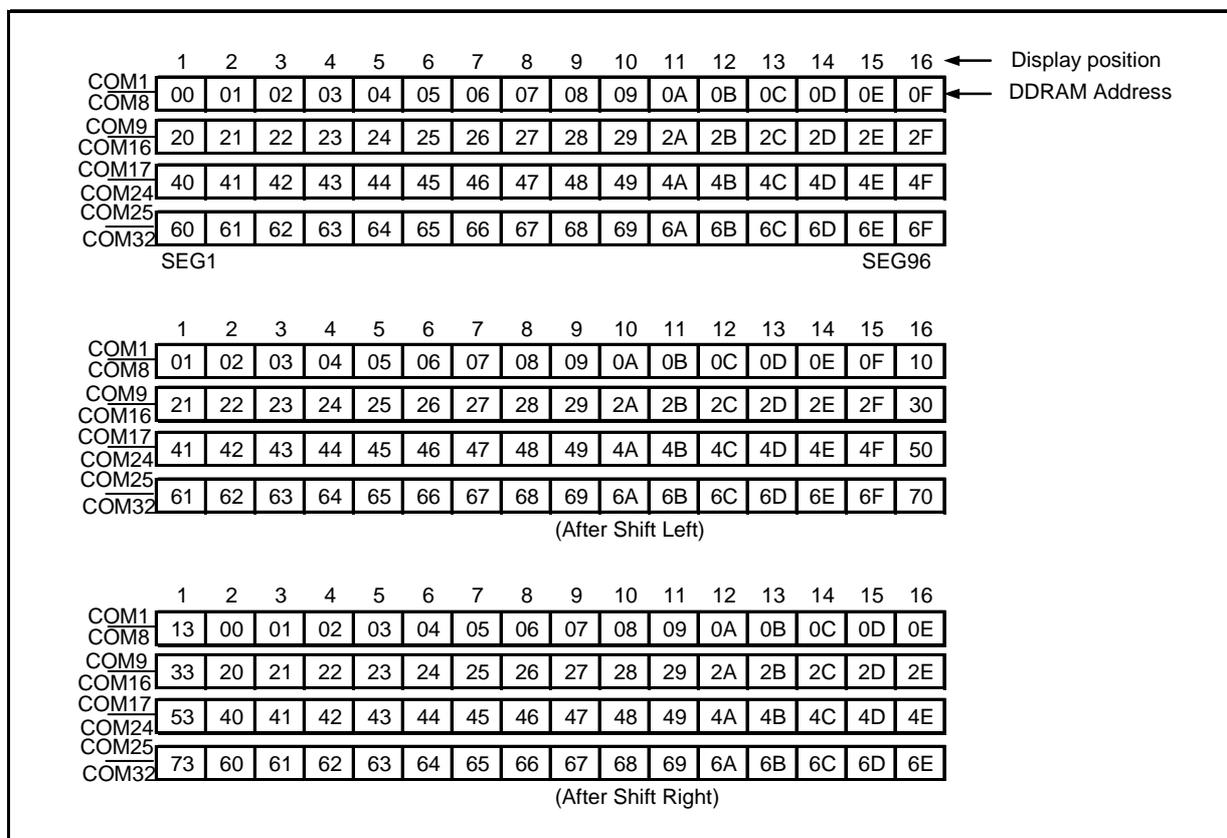

**Figure 7-8 3-line x 16ch. Display (6-dot Font Width)**

### 6-dot 4-line Display

In case of 4-line display with 6-dot font, the address range of DDARM is 00H-13H, 20H-33H, 40H-53H, 60H-73H (refer to Figure 7-9).

Figure 7-9 4-line x 16ch. Display (6-dot Font Width)

### 7.3 Timing Generation Circuit

Timing generation circuit generates clock signals for the internal operations.

### 7.4 Address Counter (AC)

Address Counter (AC) stores DDRAM/ CGRAM/ SEGRAM address, transferred from Instruction Register (IR). After writing into (reading from) DDRAM/ CGRAM/ SEGRAM, AC is automatically increased (decreased) by 1. In parallel and serial mode, when RS = "Low" and R/W = "High", AC can be read through DB0-DB6.

### 7.5 Cursor/Blink Control Circuit

It controls cursor/blink ON/OFF and black/white inversion at cursor position.

### 7.6 LCD Driver Circuit

LCD Driver circuit has 34 common and 100 segment signals for LCD driving. Data from SEGRAM/ CGRAM/ CGROM is transferred to 100-bit segment latch serially, and then it is stored to 100-bit shift latch. When each com is selected by 34-bit common register, segment data also output through segment driver from 100-bit segment latch. In case of 1-line display mode, ICON1/ICON2 and COM1-COM8 have 1/9 duty ratio; and in 4-line mode, ICON1/ICON2 and COM1-COM32 have 1/33 duty ratio.

### 7.7 CGROM (Character Generator ROM)

There is 3 optional CGROMs in SSD1803A in P.66-68 , which is selected by ROM1 and ROM2 pins. CGROM has 5 x 8 dots 256 Character Pattern.

### 7.8 CGRAM (Character Generator RAM)

CGRAM has up to 8 characters of 5 x 8 dots, selectable by OPR2 and OPR1 pins (refer to Table 7-1).

**Table 7-1: CGRAM and CGROM arrangement with**

(OPR2, OPR1) = (0, 0)

		b3-0

				.							1	1	1			0	0	0	0	0	0	

- When BE (Blink Enable bit) = "High", blink is controlled by B1 and B0 bit.  
 In case of 5-dot font width, when B1 = "1", enabled dots of P0-P4 will blink, and when B1 = "0" and B0 = "1", enabled dots in P4 will blink, when B1 = "0" and B0 = "0", blink will not happen.  
 In case of 6-dot font width, when B1 = "1", enabled dots of P0-P5 will blink, and when B1 = "0" and B0 = "1", enabled dots of P5 will blink, when B1 = "0" and B0 = "0", blink will not happen.
- "X": Don't care

## 7.9 SEGRAM (Segment Icon RAM)

SEGRAM has segment control data and segment pattern data. During display mode, ICON1 (ICON2) makes the data of SEGRAM enable to display icons. Its higher 2-bit are blinking control data, and lower 6-bits are pattern data (refer to Table 7-3 and Figure 7-10).

**Table 7-3: Relationship between SEGRAM Address and Display Pattern**

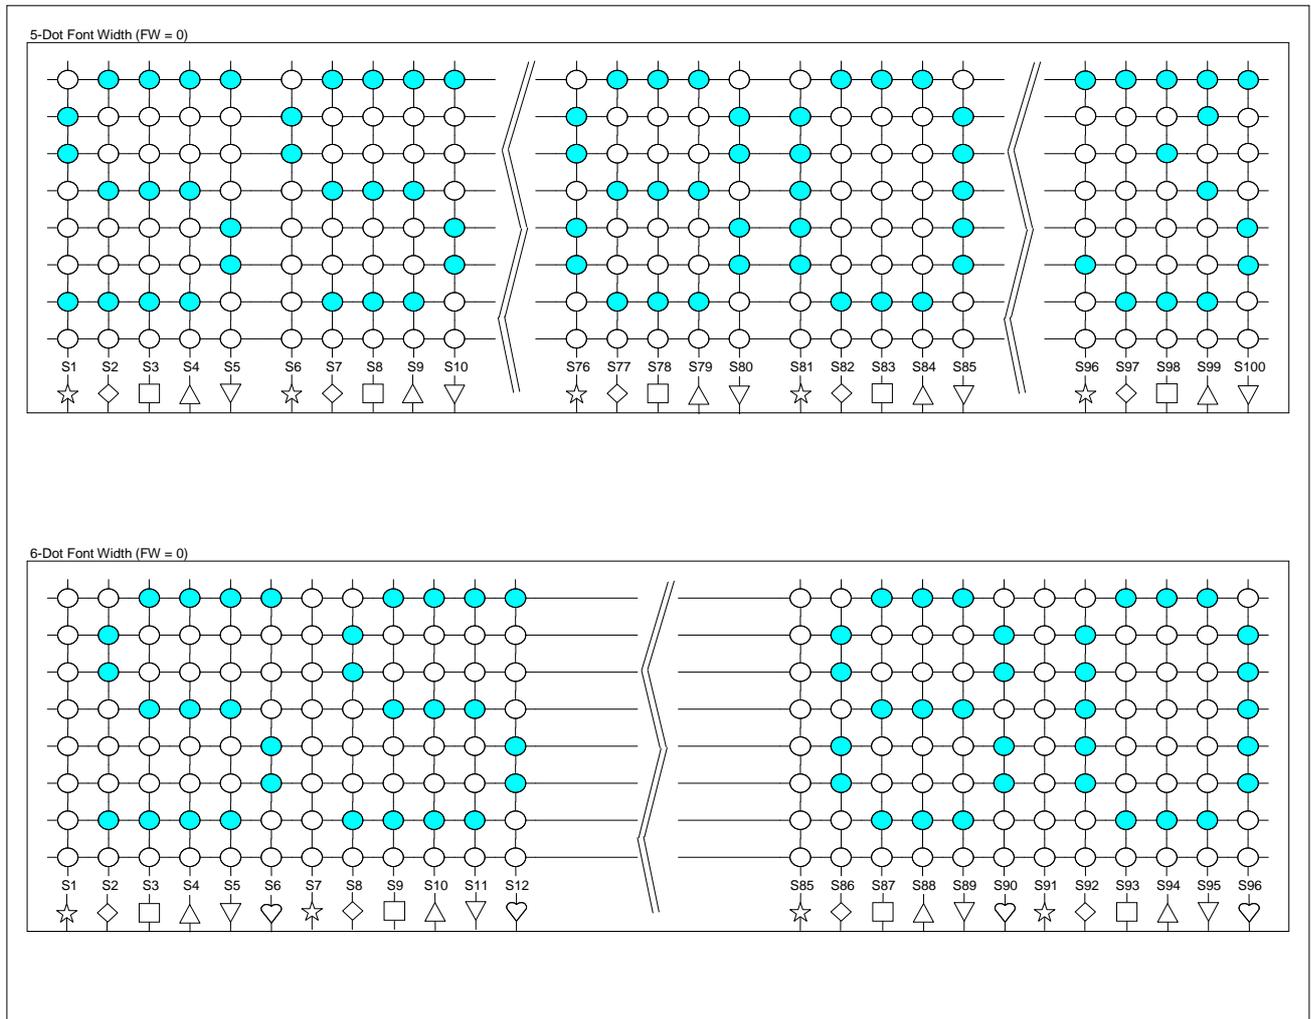

SEGRAM Address				SEGRAM Data Display Pattern															
				5-dot Font Width								6-dot Font Width

1 0 0	No blink	No blink
1 0 1	D4	D5
1 1 X	D4 - D0	D5 - D0

1. S1-S80 : Icon pattern ON/OFF in 5-dot font width  
S1-S96 : Icon pattern ON/OFF in 6-dot font width
2. "X": Don't care.

**Figure 7-10 Relationship between SEGRAM and Segment Display**

## 7.10 System Interface

This chip has all four kinds of interface type with MPU: I2C, serial, 4-bit bus and 8-bit bus. I2C, Serial and bus (4-bit/8-bit) is selected by IM1 and IM2 inputs, and 4-bit bus and 8-bit bus is selected by DL bit in the instruction register.

### 7.10.1 4-bit bus and 8-bit bus interface (IM2=H, IM1 = H)

During read or write operation, two 8-bit registers are used. One is data register (DR), the other is instruction register (IR). The data register (DR) is used as temporary data storage place for being written into or read from DDRAM/ CGRAM/SEGRAM, target RAM is selected by RAM address setting instruction. Each internal operation, reading from or writing into RAM, is done automatically. So to speak, after MPU reads DR data, the data in the next DDRAM/ CGRAM/ SEGRAM address is transferred into DR automatically. Also after MPU writes data to DR, the data in DR is transferred into DDRAM/ CGRAM/ SEGRAM automatically. The Instruction register (IR) is used only to store instruction code transferred from MPU. MPU cannot use it to read instruction data. To select register, use RS input pin in 4-bit/8-bit bus mode (IM2 = "High") or RS in serial mode (IM2 = "Low").

**Table 7-4: Bus interface operations according to RS and RW bits**

RS	RW	Operation
0	0	Instruction write operation (MPU writes Instruction code into IR)
0	1	Read busy flag (DB7) and address counter (DB0 - DB6)
1	0	Data write operation (MPU writes data into DR)
1	1	Data read operation (MPU reads data from DR/ Part ID)

- In case of 4-bit bus mode, data transfer is performed by two times to transfer 1 byte data.
- When interfacing data length is 4-bit, only 4 ports, from DB4 - DB7, are used as data bus.
- At first higher 4-bit (in case of 8-bit bus mode, the contents of DB4 - DB7) are transferred, and then lower 4-bit (in case of 8-bit bus mode, the contents of DB0 - DB3) are transferred. So transfer is performed by two times.
- When interfacing data length is 8-bit, transfer is performed at a time through 8 ports, from DB0 - DB7.
- Please refer to the 6800 interface timing in P.54.

### 7.10.2 Serial interface (IM2=L, IM1 = H)

When IM2= L and IM1=H, serial interface mode is started. At this time, all three ports, SCLK (synchronizing transfer clock), SID (serial input data), and SOD (serial output data), are used. If you want to use SSD1803A with other chips, chip select port (CS) can be used. By setting CS to "Low", SSD1803A can receive SCLK input. If CS is set to "High", SSD1803A reset the internal transfer counter.

Before transfer real data, start byte has to be transferred. It is composed of succeeding 5 "High" bits, read write control bit (R/W), register selection bit (RS) and end bit that indicates the end of start byte. Whenever succeeding 5 "High" bits are detected by SSD1803A, it makes serial transfer counter reset and ready to receive next information.

The next input data are register selection bit that determine which register will be used, and read write control bit that determine the direction of data. Then end bit is transferred, which must have "Low" value to show the end of start byte. (Refer to Figure 7-11 and Figure 7-12)

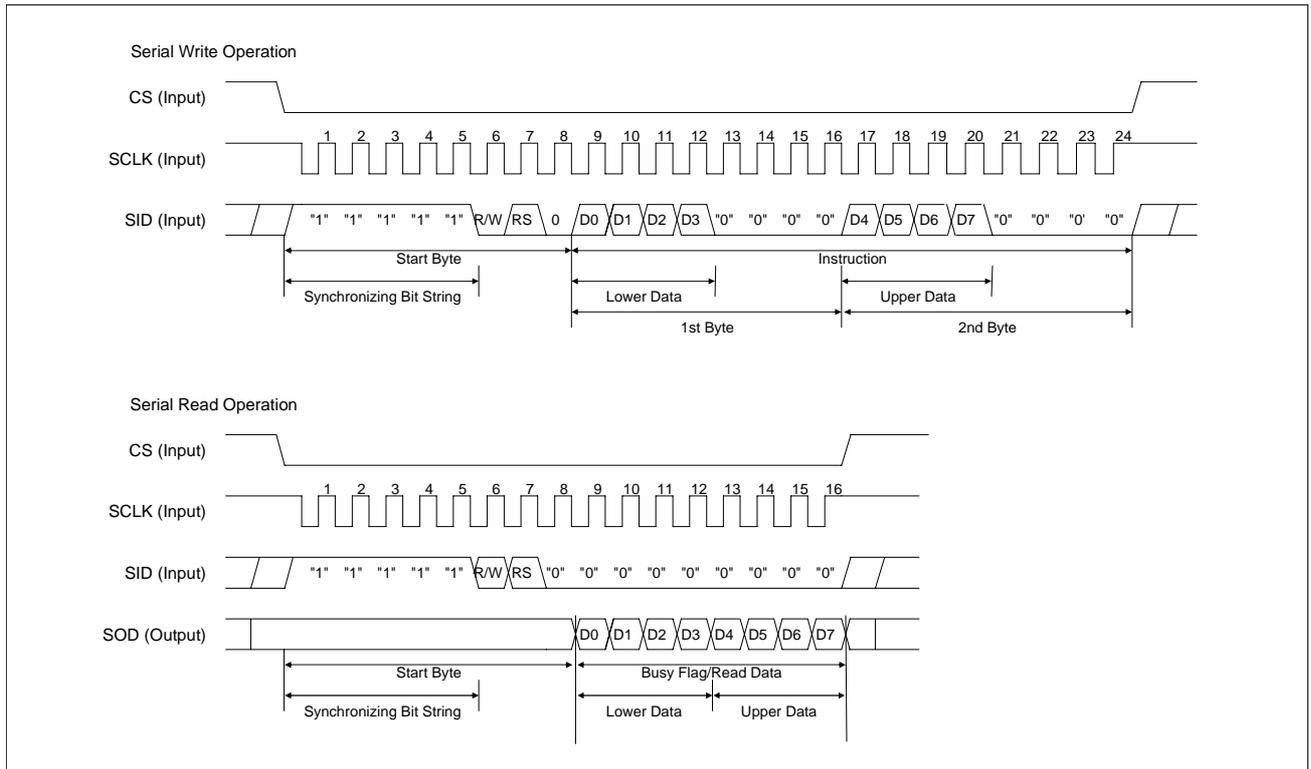

#### Write Operation (R/W = 0)

After start byte is transferred from MPU to SSD1803A, 8-bit data is transferred which is divided into 2 bytes, each byte has 4 bit's real data and 4 bit's partition token data. For example, if real data is "10110001" (D0 - D7), then serially transferred data becomes "1011 0000 0001 0000" where 2nd and 4th 4 bits must be "0000" for safe transfer. To transfer several bytes continuously without changing RS bit and RW bit, start byte transfer is needed only at first starting time. Namely, after first start byte is transferred, real data can be transferred succeeding.

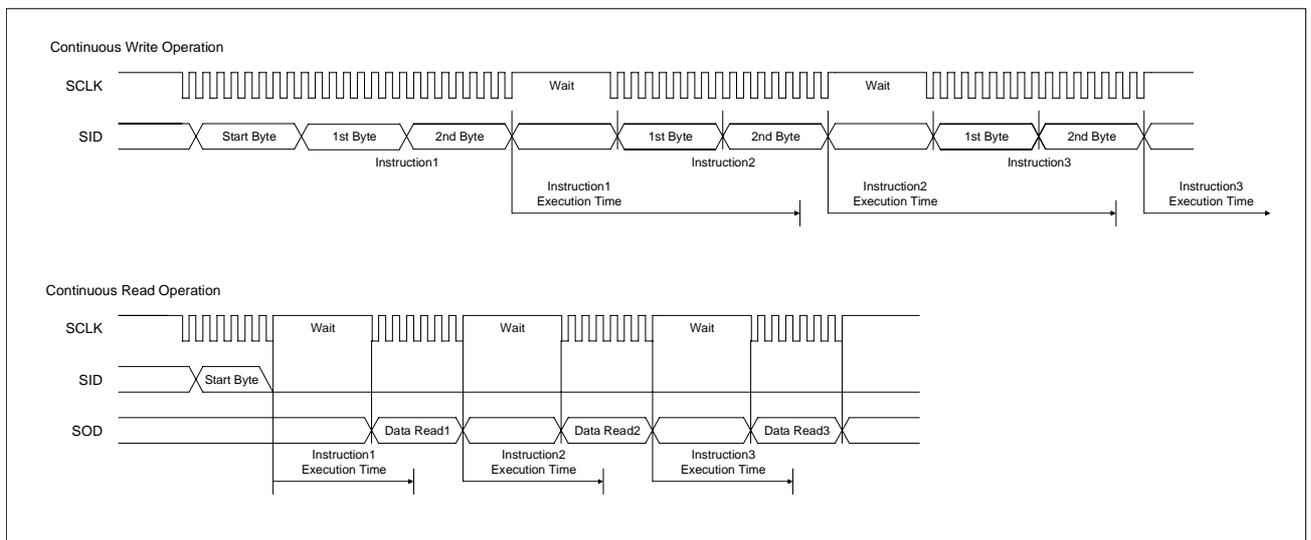

#### Read Operation (R/W = 1)

After start byte is transferred to SSD1803A, MPU can receive 8-bit data through the SOD port at a time from the LSB. Wait time is needed to insert between start byte and data reading, because internal reading from RAM requires some delay. Continuous data reading is possible like serial write operation. It also needs only one start byte, only if you insert some delay between reading operations of each byte. During the reading operation, SSD1803A observes succeeding 5 "High" from MPU. If it is detected, SSD1803A restarts serial operation at once and ready to receive RS bit. So in continuous reading operation, SID port must be "Low".

**Figure 7-11 Timing Diagram of Serial Data Transfer**

**Figure 7-12 Timing Diagram of Continuous Data Transfer**

### 7.10.3 I2C interface

SSD1803A supports I2C interface with a bit rate up to 400 kbits/s. It enables write/ read data or busy flag and supports only the mandatory slave feature showed below.

**Slaver address could be set to “011 1100” or “011 1101” by SA0 pin.**

The I2C interface send RAM data and executes the commands sent via the I2C Interface. It could send data in to the RAM. The I2C Interface is two-line communication between different ICs or modules. The two lines are a Serial Data line (SDA) and a Serial Clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy. (Note: SDAin and SDAout are short together and forms SDA in SSD1803A)

#### Bit Transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse because changes in the data line at this time will be interpreted as a control signal. Bit transfer is illustrated in Figure 7-13.

#### Start and Stop conditions

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the START condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition (P). The START and STOP conditions are illustrated in Figure 7-14.

#### System Configuration

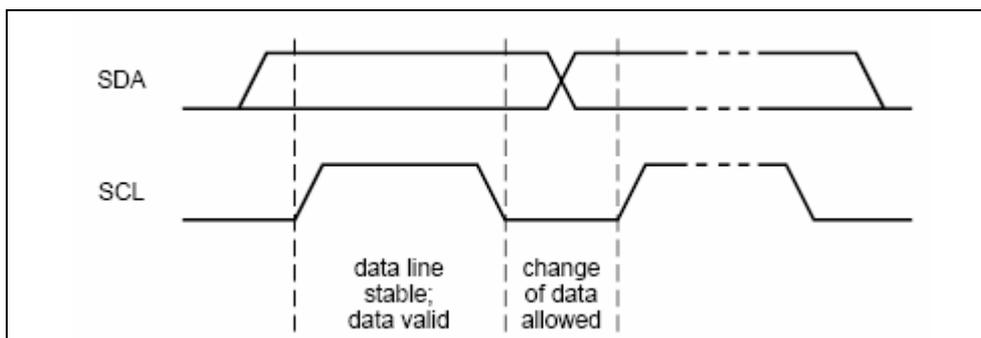

The system configuration consists of

- Transmitter: the device, which sends the data to the bus
- Master: the device, which initiates a transfer, generates clock signals and terminates a transfer
- Slave: the device addressed by a master
- Multi-Master: more than one master can attempt to control the bus at the same time without corrupting the message
- Arbitration: procedure to ensure that, if more than one master simultaneously tries to control the bus, only one is allowed to do so and the message is not corrupted
- Synchronization: procedure to synchronize the clock signals of two or more devices.

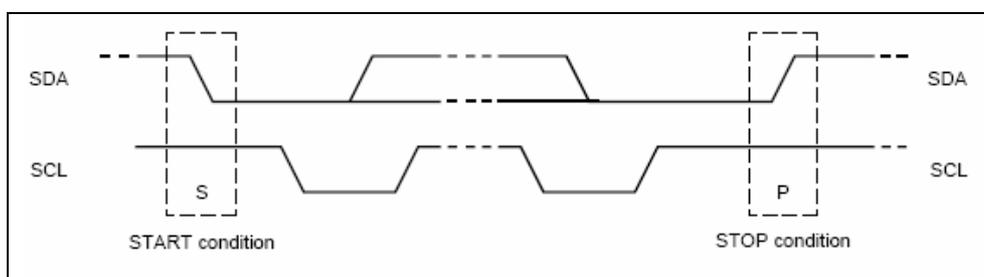

#### Acknowledge

Each byte of eight bits is followed by an acknowledge bit. The acknowledge bit is a HIGH signal put on the bus by the transmitter during which time the master generates an extra acknowledge related clock pulse. A slave receiver which is addressed must generate an acknowledge after the reception of each byte. A master receiver must also generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse (set-up and hold times must be taken into consideration). A master receiver must signal an end-of-data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event the transmitter must leave the data line HIGH to enable the master to generate a STOP condition. Acknowledgement on the I2C Interface is illustrated in Figure 7-15.

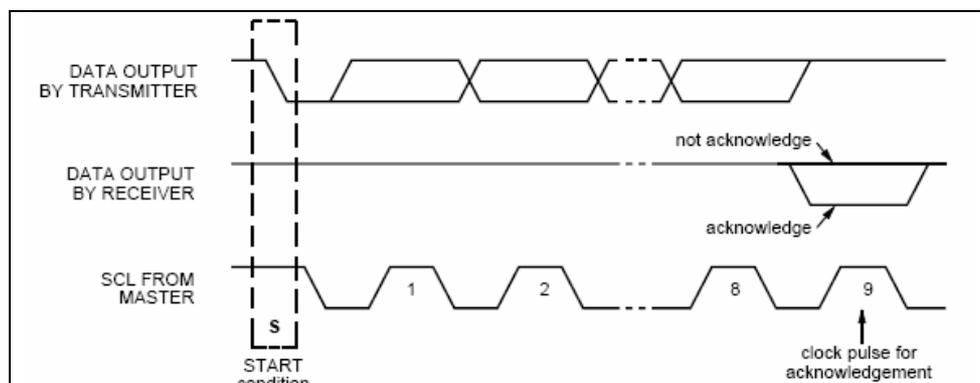

**Figure 7-13: Bit transfer on the I2C-bus**

**Figure 7-14: START and STOP conditions**

**Figure 7-15: Acknowledge on the I2C bus**

## I2C Interface Protocol

The SSD1803A supports command, data read/ write addressed slaves on the bus.

Before any data is transmitted on the I2C Interface, the device, which should respond, is addressed first. Two 7-bit slave addresses (0111100 to 0111101) are reserved for the SSD1803A. The R/W# is assigned to 0 for Write and 1 for Read. The I2C Interface protocol is illustrated in Figure 7-16 to 7-18.

The sequence is initiated with a START condition (S) from the I2C Interface master, which is followed by the slave address. All slaves with the corresponding address acknowledge in parallel, all the others will ignore the I2C Interface transfer. After acknowledgement, one or more command words follow which define the status of the addressed slaves.

A command word consists of control byte, which defines C0 and D/C#, plus a data byte.

The last control byte is tagged with a cleared most significant bit (i.e. the continuation bit Co). After the last control byte with a cleared Co bit, only data bytes will follow. The state of the D/C# bit defines whether the data byte is interpreted as a command or as RAM data. All addressed slaves on the bus also acknowledge the control and data bytes. After the last control byte, depending on the D/C# bit setting; either a series of display data bytes or command data bytes may follow. If the D/C# bit is set to logic 1, these display bytes are stored in the display RAM at the address specified by the data pointer. The data pointer is automatically updated and the data is directed to the intended SSD1803A device. If the D/C# bit of the last control byte is set to logic 0, these command bytes will be decoded and the setting of the device will be changed according to the received commands. Only the addressed slave makes the acknowledgement after each byte. At the end of the transmission the I2C INTERFACE-bus master issues a STOP condition (P).

**Figure 7-16: I2C write mode**

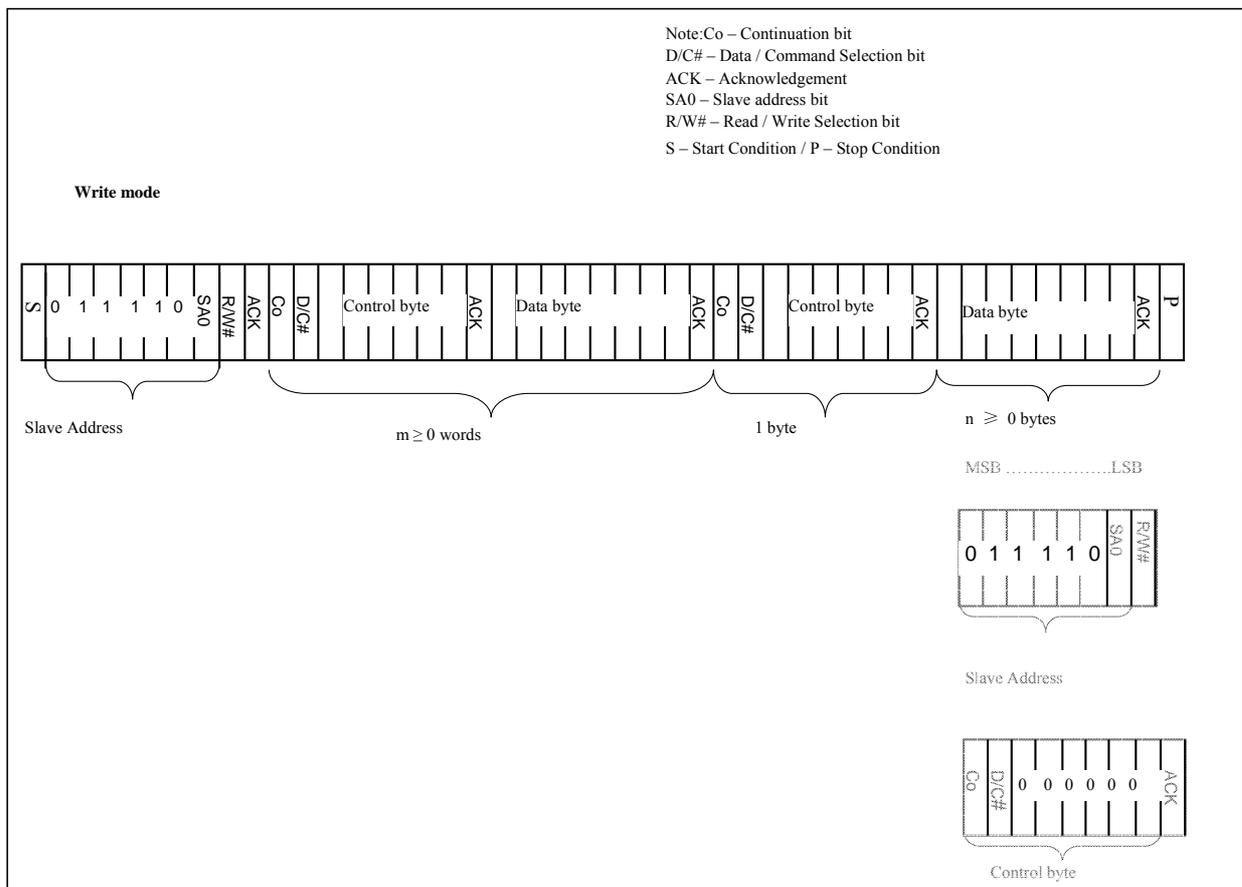

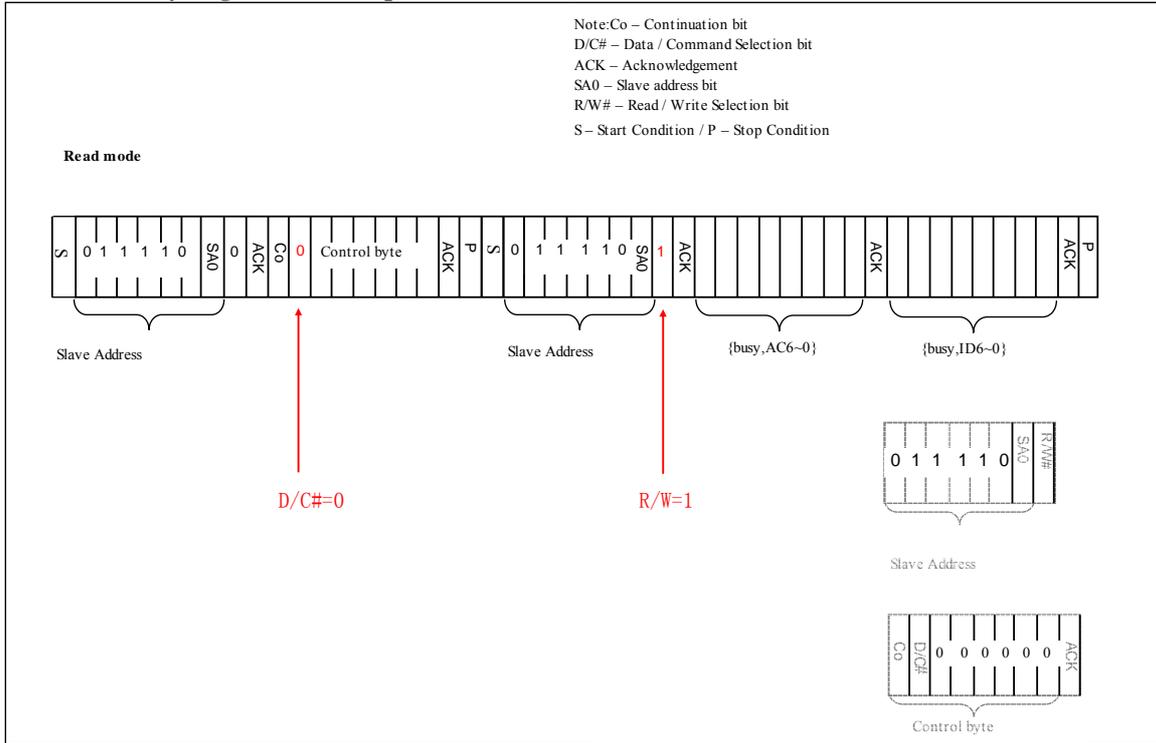

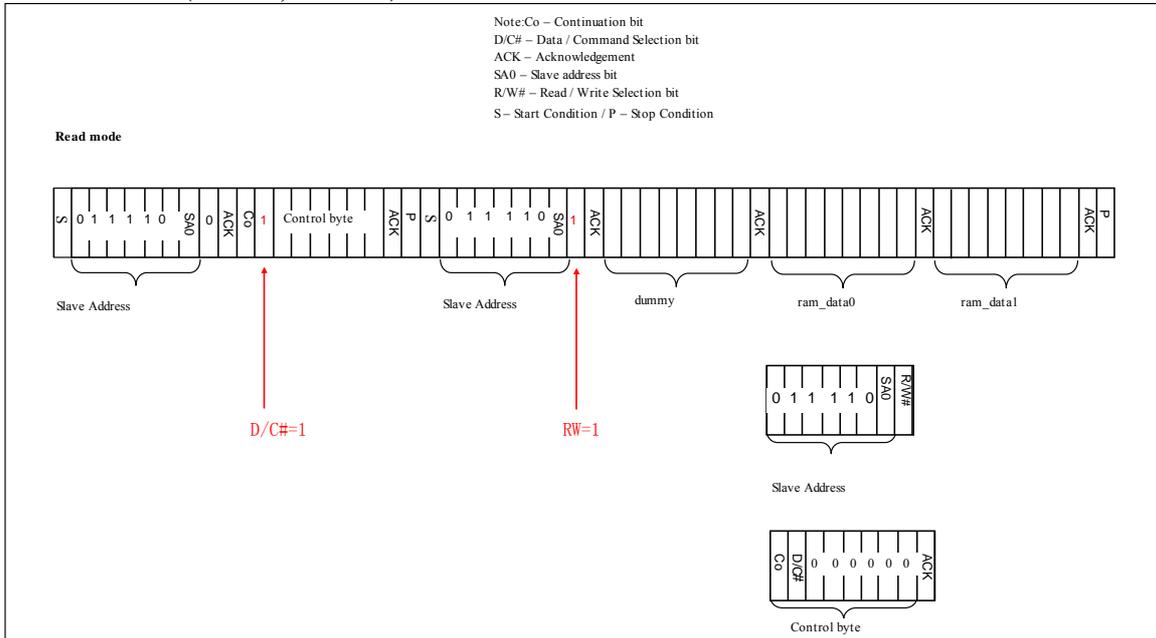

Figure 7-17: I2C read mode

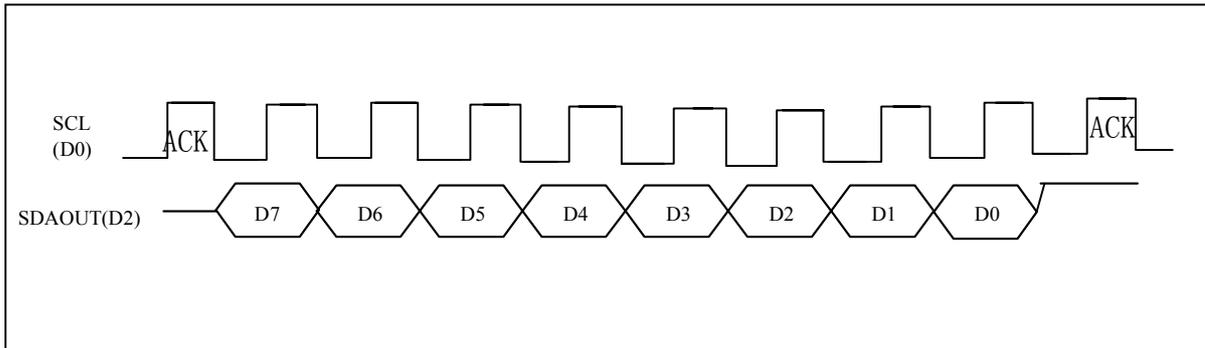

Read busy flag and address/part ID (D/C#=0, R/W#=1)

Read ram (D/C#=1, R/W#=1)

**Figure 7-18: Read Timing**

During read or write operation, two 8-bit registers are used. One is data register (DR), the other is instruction register (IR). The data register (DR) is used as temporary data storage place for being written into or read from DDRAM/ CGRAM/SEGRAM, target RAM is selected by RAM address setting instruction. Each internal operation, reading from or writing into RAM, is done automatically. So to speak, after MPU reads DR data, the data in the next DDRAM/ CGRAM/ SEGRAM address is transferred into DR automatically. Also after MPU writes data to DR, the data in DR is transferred into DDRAM/ CGRAM/ SEGRAM automatically. The Instruction register (IR) is used only to store instruction code transferred from MPU. MPU cannot use it to read instruction data. To select register, use D/C# I2C mode.

**Table 7-5: Bus interface operations according to D/C# and R/W# inputs**

D/C#	R/W#	Operation
0	0	Instruction write operation (MPU writes Instruction code into IR)
0	1	Read busy flag (DB7) and address counter (DB0 - DB6)
1	0	Data write operation (MPU writes data into DR)
1	1	Data read operation (MPU reads data from DR/ Part ID)

## 7.11 5V IO regulator

SSD1803A accepts two power supply range:  
 2.4-3.6V [**Low Voltage I/O Application**] and  
 4.5-5.5V [**5V I/O Application**]

5V IO Regulator is enabled to regulate 5V I/O input to 3V for power supply of internal circuit blocks.

Note: In 5V I/O Application, VOUT should not be lower than VDDIO.

Table 7-6 summarizes the input/ output connection of 5V IO regulator in normal application.

**Table 7-6: 5V IO regulator pin description**

Pin Name	Low Voltage I/O Application	5V I/O Application
VDDREG	Low, disable 5V IO regulator	High, enable 5V IO regulator
VCI	Short to VDD	Short to VDD
VDD	2.4 -3.6V	NC with stabilizing capacitor It outputs 3V
VDDIO	2.4 -VCI	4.5 -5.5V

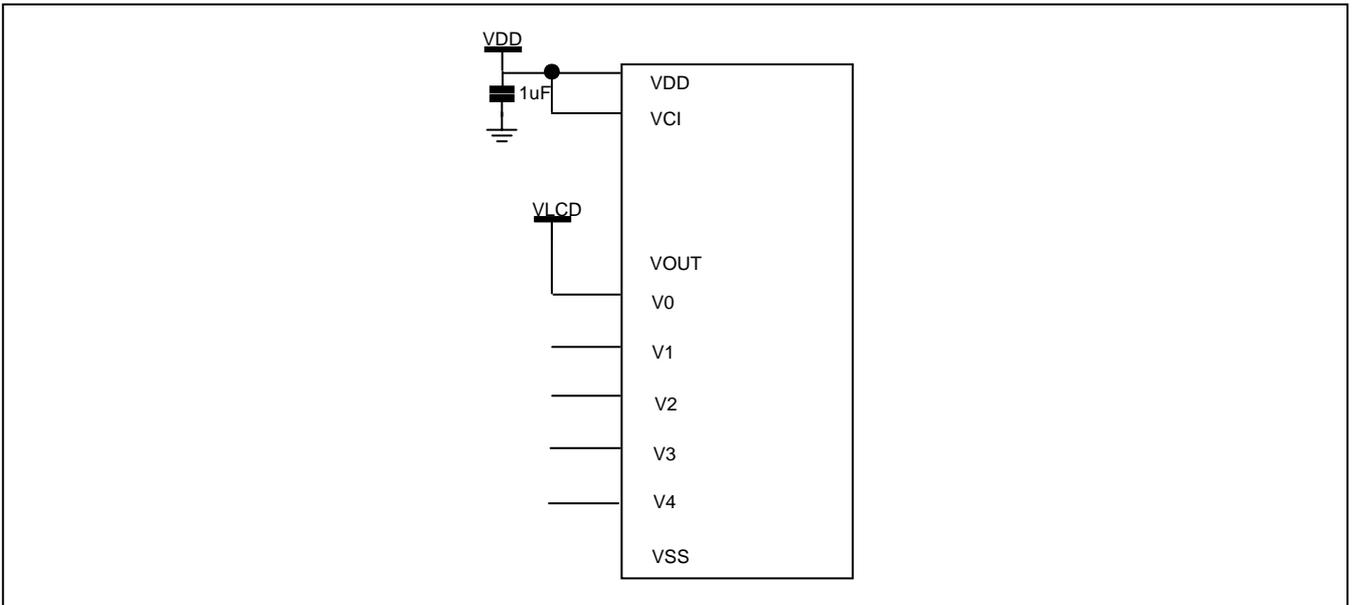

## 7.12 LCD Driving Voltage Generator and Regulator

This module generates the LCD voltage required for display driving output.

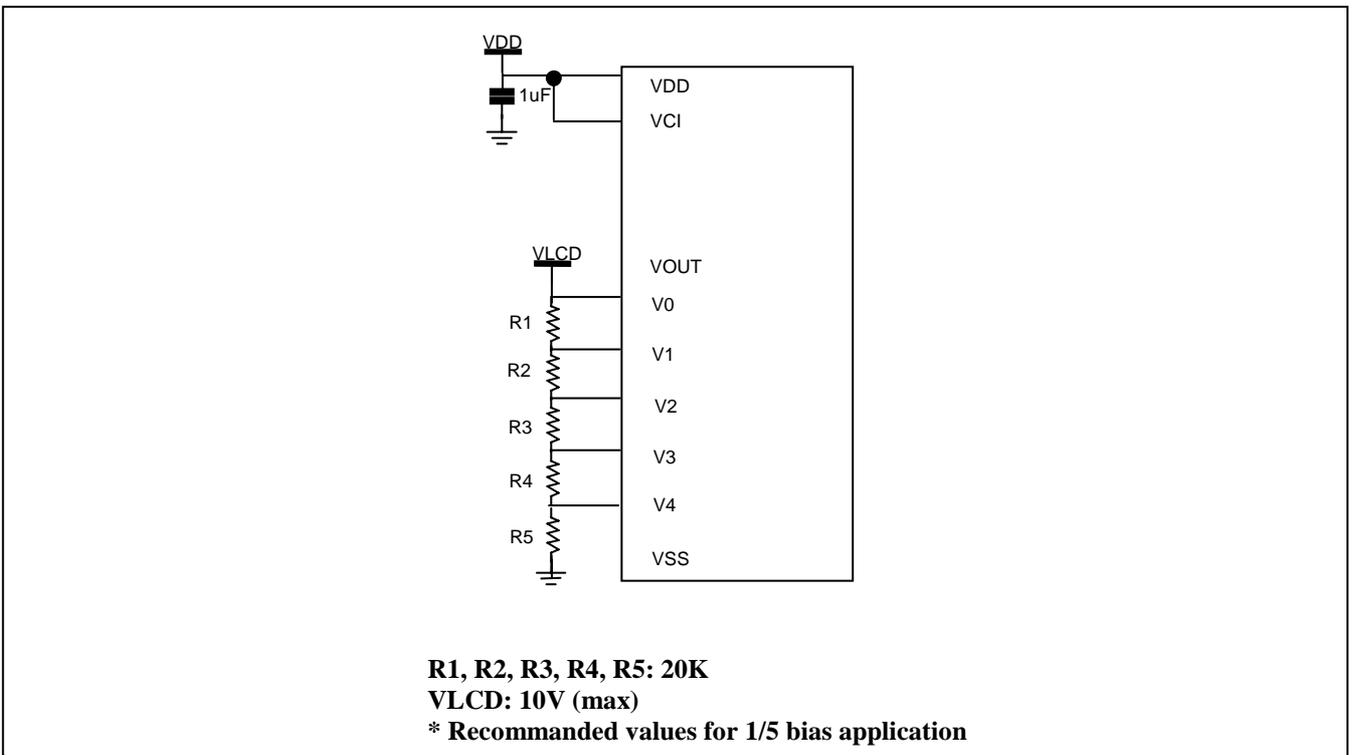

### 7.12.1 External VLCD mode

When on-chip booster is turned off, VLCD can be supplied externally to V0 for display driving.

**Figure 7-19: On-chip voltage converter application set up  
When booster is off and voltage follower is on (Bon=0; Don=1)**

**Figure 7-20: On-chip voltage converter application set up  
When both booster and voltage follower is off (Bon=0; Don=0)**

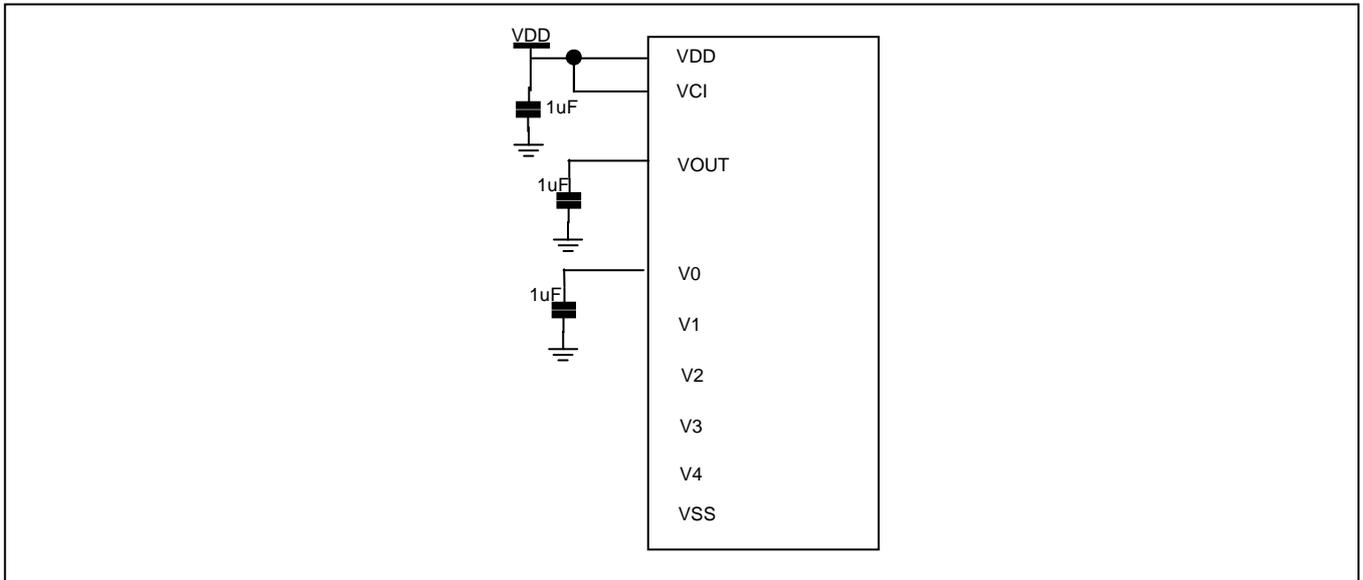

## 7.12.2 Internal voltage mode

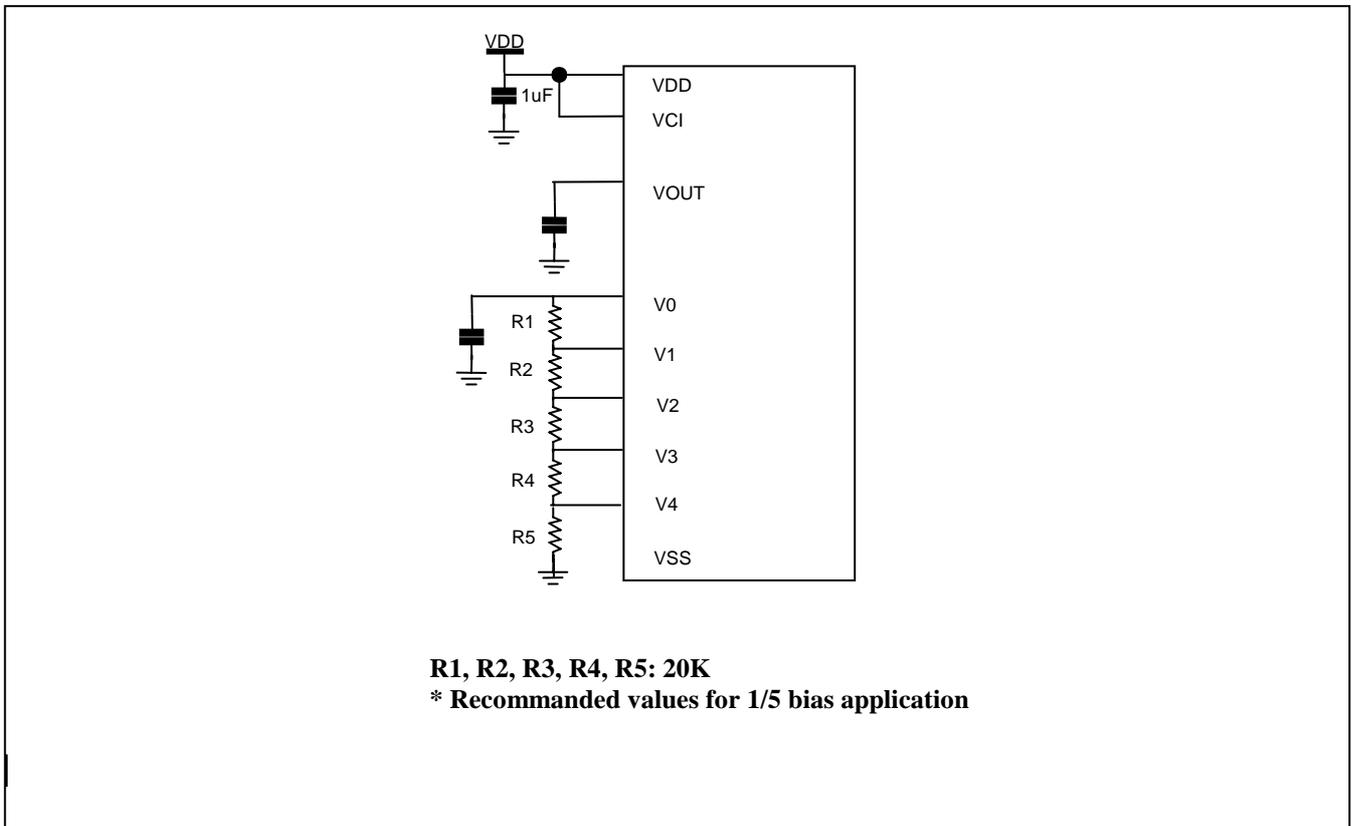

### a) On-chip DC-DC voltage converter

Voltage converter is available when  $Bon=1$ . Figure 7-21 shows the circuits boosting up the electric potential between  $VDD - VSS$  toward positive side and boosted voltage is output at  $VOUT$ .

**Figure 7-21: On-chip voltage converter application set up  
When both booster and voltage follower is on ( $Bon=1$ ;  $Don=1$ )**

**Figure 7-22: On-chip voltage converter application set up  
When both booster is on and voltage follower is off ( $Bon=1$ ;  $Don=0$ )**

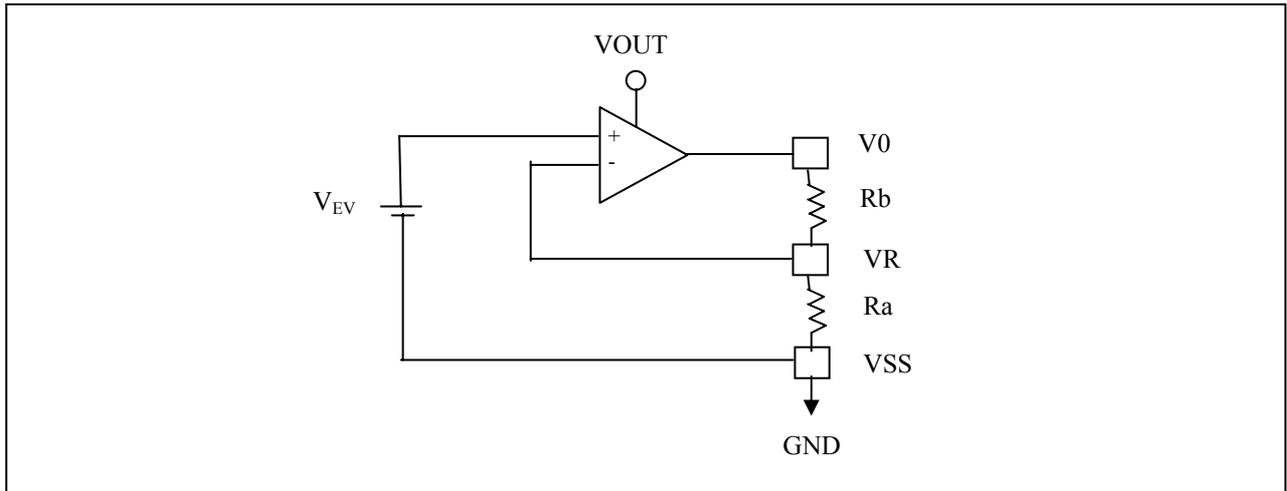

**b) Voltage regulator circuits (Gain) and Contrast Control**

There is a voltage regulator circuit to determine liquid crystal operating voltage,  $V_0$ , by adjusting resistors,  $R_a$  and  $R_b$ , within the range of  $|V_4| < |V_0|$ . The circuit which is turned on with a voltage converter consists of an operational-amplifier circuit and a feedback gain control.

$V_{OUT}$  is the operating voltage for the op-amp, it is required to supply internally or externally. It consists of a feedback gain control for LCD driving contrast curves, eight settings can be selected through software command (Internal resistor ratio  $R_{ab2} \sim 0$ ).

**Figure 7-23: Voltage regulator circuit**

Also, software command (C1-5) is used to adjust the 64 contrast voltage levels at each voltage regulator feedback gain. The equation of calculating the LCD driving voltage is given as:

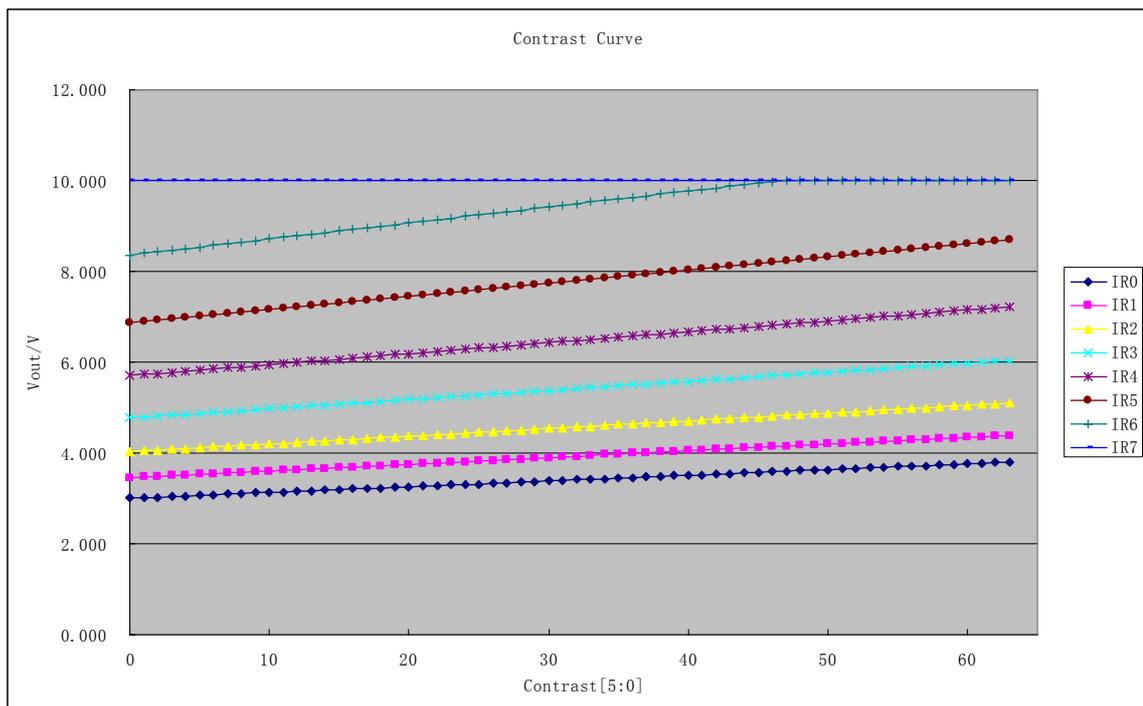

$$V_0 = \left(1 + \frac{R_b}{R_a}\right) \times V_{EV} [V] \text{ -----(Equation 1)}$$

$$V_{EV} = \left[1 - \frac{(63 - \alpha)}{300}\right] \times V_{REF} [V] \text{ --(Equation 2)}$$

, where  $V_{REF} = 2$  and  $\alpha =$  contrast setting <sub>(d)</sub>

Please refer to Figure 7-24 for the contrast curve with 8 sets of internal resistor network gain.

Figure 7-24: Contrast curve

**c) Bias Divider**

If the Don command is enabled, this circuit block will divide the voltage regulator circuit output (V0) to give the LCD driving levels. External stabilizing capacitors for the divider are optional to reduce the external hardware and pin counts.

**d) Bias Ratio Selection circuitry**

The software control circuit of 1/4 to 1/7 bias ratio in order to match the characteristic of LCD panel.

**e) Self adjust temperature compensation circuitry**

Provide 4 different compensation grade selections to satisfy the various liquid crystal temperature grades (-0.05%, -0.10%, -0.15%, -0.20%). The grading can be selected by software control. Defaulted temperature coefficient (TC) value is  $-0.05\%/^{\circ}\text{C}$ .

**7.13 Oscillator Circuit**

This module is an On-Chip low power temperature compensation oscillator circuitry. The oscillator generates the clock for the DC-DC voltage converter and the Display Timing Generator. User may choose to use internal oscillator clock or supply external clock by CLS pin.

## 8 Command Table

**Table 8-1: Instruction Set**

Instruction	IS	RE	Instruction Code										Description	
			RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0		
Clear display	X	X	0	0	0	0	0	0	0	0	0	0	1	Write "20H" to DDRAM. and set DDRAM address to "00H" from AC.
Return home	X	0	0	0	0	0	0	0	0	0	0	1	X	Set DDRAM address to "00H" from AC and return cursor to its original position if shifted. The contents of DDRAM are not changed.
Power down mode	X	1	0	0	0	0	0	0	0	0	0	1	PD	Set power down mode bit. PD = "1": power down mode set, PD = "0": power down mode disable (POR)
Entry mode set	X	0	0	0	0	0	0	0	0	0	1	I/D	S	Assign cursor/ blink moving direction with DDRAM address I/D = "1": cursor/ blink moves to right and DDRAM address is increased by 1 (POR) I/D = "0": cursor/ blink moves to left and DDRAM address is decreased by 1 Assign display shift with DDRAM address S = "1": make display shift of the enabled lines by the DS4 to DS1 bits in the shift enable instruction. Left/ right direction depends on I/D bit selection. S = "0": display shift disable (POR)
	X	1	0	0	0	0	0	0	0	0	1	BDC	BDS	Segment bi-direction function. BDS = "0": Seg100 -> Seg1, BDS = "1": Seg1 -> Seg100. Segment bi-direction function. BDC = "0": Com32 -> Com1 BDC = "1": Com1 -> Com32
Display On/Off control	X	0	0	0	0	0	0	0	0	1	D	C	B	Set display/cursor/blink on/off D = "1": display on, D = "0": display off (POR), C = "1": cursor on, C = "0": cursor off (POR), B = "1": blink on, B = "0": blink off (POR).
Extended function set	X	1	0	0	0	0	0	0	0	1	FW	B/W	NW	Assign font width, black/white inverting of cursor, and 4-line display mode control bit. FW = "1": 6-dot font width, FW = "0": 5-dot font width (POR), B/W = "1": black/white inverting of cursor enable, B/W = "0": black/white inverting of cursor disable (POR) NW = "1": 3-line or 4-line display mode, NW = "0": 1-line or 2-line display mode
Cursor or display shift	0	0	0	0	0	0	0	0	1	S/C	R/L	x	x	Set cursor moving and display shift control bit, and the direction, without changing DDRAM data. S/C = "1": display shift, S/C = "0": cursor shift, R/L = "1": shift to right, R/L = "0": shift to left.

\*POR stands for Power On Reset Values.

Instruction	IS	RE	Instruction Code										Description
			RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
Double height(4-line)/ Bias/ Display-dot shift	0	1	0	0	0	0	0	1	UD2	UD1	BS1	DH'	UD2~1: Assign different doubt height format (POR=11)  BS1:BS0 = "00": 1/5 bias (POR) BS1:BS0 = "01": 1/4 bias BS1:BS0 = "10": 1/7 bias BS1:BS0 = "11": 1/6 bias  DH' = "1": display shift enable DH' = "0": dot scroll enable (POR)
Internal OSC frequency	1	0	0	0	0	0	0	1	BS0	F2	F1	F0	F2~0: adjust internal OSC frequency for FE frequency (POR: 011)
Shift enable	1	1	0	0	0	0	0	1	DS4	DS3	DS2	DS1	(when DH' = "1") POR DS4~1=1111 Determine the line for display shift. ## 9 COMMAND DESCRIPTIONS

### 9.1 Clear Display

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	0	1

Clear all the display data by writing "20H" (space code) to all DDRAM address, and set DDRAM address to "00H" into AC (address counter). Return cursor to the original status, namely, bring the cursor to the left edge on first line of the display. Make entry mode increment (I/D = "1").

### 9.2 Return Home (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	X

Return Home is cursor return home instruction. Set DDRAM address to "00H" into the address counter. Return cursor to its original site and return display to its original status, if shifted. Contents of DDRAM do not change.

### 9.3 Power Down Mode set (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	PD

Power down mode enable bit set instruction. When PD = "High", it makes SSD1803A suppress current consumption except the current needed for data storage by executing next three functions.

- Make the output value of all the COM/SEG ports VSS
- Disable voltage converter to remove the current through the divide resistor of power supply. You can use this instruction as power sleep mode.
- When PD = "Low", power down mode becomes disabled.

## 9.4 Entry Mode Set

### RE = 0

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	I/D	S

Set the moving direction of cursor and display.

I/D: Increment/decrement of DDRAM address (cursor or blink)

When I/D = "High", cursor/blink moves to right and DDRAM address is increased by 1.

When I/D = "Low", cursor/blink moves to left and DDRAM address is decreased by 1.

- CGRAM/SEGRAM operates the same as DDRAM, when read from or write to CGRAM/SEGRAM.

When S = "High", after DDRAM write, the display of enabled line by DS1 - DS4 bits in the shift enable instruction is shifted to the right (I/D = "0") or to the left (I/D = "1"). But it will seem as if the cursor does not move. When S = "Low", or DDRAM read, or CGRAM/SEGRAM read/write operation, shift of display like this function is not performed.

### RE = 1

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1	BDC	BDS

Set the data shift direction of segment in the application set.

BDC: Data shift direction of common

When BDC = "Low", common data shift direction is set to reverse from COM32 to COM1.

When BDC = "High", common data shift direction is set to normal order from COM1 to COM32.

BDS: Data shift direction of segment

When BDS = "Low", segment data shift direction is set to reverse from SEG100 to SEG1.

When BDS = "High", segment data shift direction is set to normal order from SEG1 to SEG100.

By using this instruction, you can raise the efficiency of application board area.

- The BID setting instruction is recommended to be set at the same time level of function set instruction.

## 9.5 Display ON/OFF Control (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	D	C	B

Control display/cursor/blink ON/OFF 1 bit register.

D: Display ON/OFF control bit

When D = "High", entire display is turned on.

When D = "Low", display is turned off, but display data is remained in DDRAM.

C: Cursor ON/OFF control bit

When C = "High", cursor is turned on.

When C = "Low", cursor is disappeared in current display, but I/D register remains its data.

B: Cursor Blink ON/OFF control bit

When B = "High", cursor blink is on, that performs alternate between all the high data and display character at the cursor position. If fosc has 540kHz frequency, blinking has 370 ms interval.

When B = "Low", blink is off.

## 9.6 Extended Function Set (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	FW	B/W	NW

FW: Font Width control

When FW = "High", display character font width is assigned to 6-dot and execution time becomes 6/5 times than that of 5-dot font width.

The user font, specified in CGRAM, is displayed into 6-dot font width, bit-5 to bit-0, including the leftmost space bit of CGRAM. (refer to Figure 9-1)

When FW = "Low", 5-dot font width is set.

B/W: Black/White Inversion enable bit

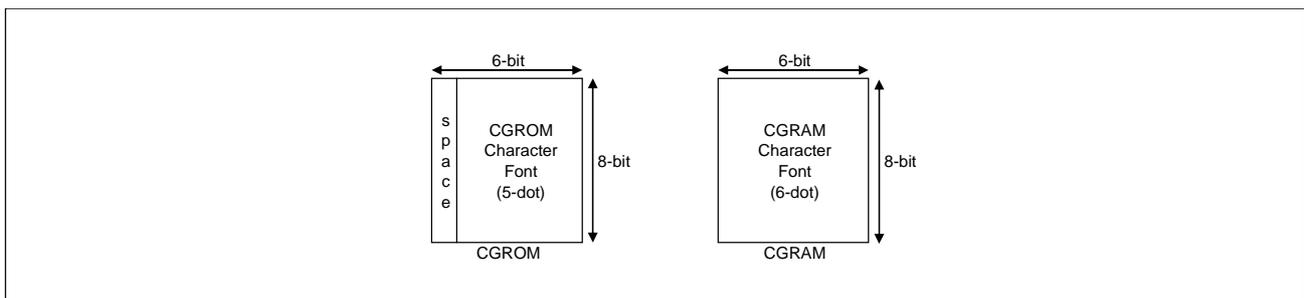

When B/W = "High", black/white inversion at the cursor position is set. In this case C/B bit of display ON/OFF control instruction becomes don't care condition. If fosc has frequency of 540kHz, inversion has 370 ms intervals.

NW: 4 Line mode enable bit

When NW = "High", 3 or 4 line display mode is set. In this case N bit of function set instruction becomes don't care condition.

When NW = "Low", 1 or 2 line display mode is set. In this case N bit of function set instruction becomes don't care condition.

Figure 9-1: 6-dot Font Width CGROM/CGRAM

## 9.7 Cursor or Display Shift / Bias Ratio Select (IS = 0, RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	S/C	R/L	X	X

Shift right/left cursor position or display, without writing or reading of display data, this instruction is use to corrector search display data (refer to Table 9-1). During 2-line mode display, cursor moves to the 2nd line after 40th digit of 1st line. When 4-line mode, cursor moves to the next line, only after every 20th digit of the current line. Note that display shift is performed simultaneously in all the line enabled by DS1-DS4 in the shift enable instruction. When displayed data is shifted repeatedly, each line shifted individually. When display shift is performed, the contents of address counter are not changed.

Table 9-1: Shift patterns According to S/C and R/L Bits

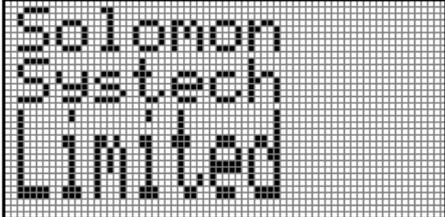

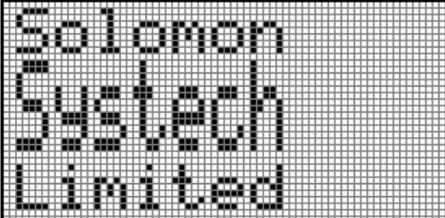

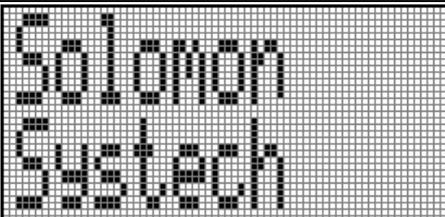

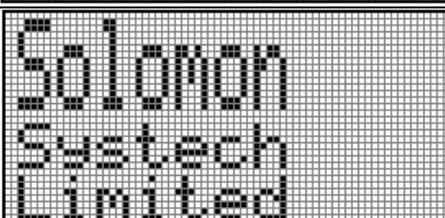

S/C	R/L	Operation
0	0	Shift cursor to the left, address counter is decreased by 1.
0	1	Shift cursor to the right, address counter is increased by 1
1	0	Shift all the display to the left, cursor moves according to the display.
1	1	Shift all the display to the right, cursor moves according to the display.

### 9.8 Double height(4-line)/ Bias/ Display-dot shift (IS = 0, RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	UD2	UD1	BS1	DH'

UD2, UD1: Assign different double height features, it is applicable to different line display mode when DH=1. Note that UD1=0 and UD2=0 are forbidden in 2-line display mode. UD1=0 is forbidden in 3-line display mode.

**Table 9-2: Double Height Display According to UD2 and UD1 Bits (when DH=1)**

UD2	UD1	Character Displays
0	0	
0	1	
1	0	
1	1	

BS1, BS0 (included in Internal divider/ OSC frequency register) define the internal divider bias:

**Table 9-3: Bias divider According to BS1 and BS0 Bits**

BS1	BS0	Bias
0	0	1/5 bias (POR)
0	1	1/4 bias
1	0	1/7 bias
1	1	1/6 bias

DH': Display shift enable selection bit.

When DH' = "High", display shift per line becomes enable.

When DH' = "Low", smooth dot scroll becomes enable.

## 9.9 Internal divider / OSC frequency (IS = 1, RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	BS0	F2	F1	F0

BS0 works with BS1, which is defined in Table 9-3

F2 : 0 : defines internal oscillator frequency

**Table 9-4: Oscillator Frequency According to F2:0 bits**

F2	F1	F0	Oscillator Frequency (kHz)
1	1	1	680
1	1	0	640
1	0	1	620
1	0	0	580
0	1	1	540(POR)
0	1	0	500
0	0	1	460
0	0	0	420

## 9.10 Shift/Scroll Enable (IS =1, RE = 1)

**DH' = 0**

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	HS4	HS3	HS2	HS1

HS: Horizontal scroll per line enable

This instruction makes valid dot shift by a display line unit. HS1, HS2, HS3 and HS4 indicate each line to be dot scrolled, and each scroll is performed individually in each line.

If you want to scroll the line in 1-line display mode, set HS1 to “High”.

If the 2nd line scroll is needed in 2-line mode, set HS2 to “High”. (refer to Table 9-5)

**DH' = 1**

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	DS4	DS3	DS2	DS1

DS: Display shift per line enable this instruction selects shifting line to be shifted according to each line mode in display shift right/left instruction. DS1, DS2, DS3 and DS4 indicate each line to be shifted, and each shift is performed individually in each line.

If you set DS1 and DS2 to “High” (enable) in 2 line mode, 1st line and 2nd line are shifted. If all the DS bits (DS1 to DS4) are set to “Low” (disable), no display is shifted.

**Table 9-5: Relationship between DS and COM signal**

Enable Bit	Enabled Common Signals During Shift	Description
HS1/DS1	COM1 – COM8	The part of display line that corresponds to enabled common signal can be shifted.
HS2/DS2	COM9 – COM16	
HS3/DS3	COM17 – COM24	
HS4/DS4	COM25 – COM32	

## 9.11 Function Set

### RE = 0

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	DL	N	DH	RE(0)	IS

DL: Interface data length control bit

When DL = “High”, it means 8-bit bus mode with MPU.

When DL = “Low”, it means 4-bit bus mode with MPU.

So to speak, DL is a signal to select 8-bit or 4-bit bus mode.

When 4-bit bus mode, it needs to transfer 4-bit data by two times.

N: Display line number control bit

It is variable only when NW bit of extended function set instruction is low.

When N = “Low”, 1-line display mode (for NW=0), or 3-line display mode (for NW=1).

When N = “High”, 2-line display mode is set (for NW=0), or 4-line display mode (for NW=1).

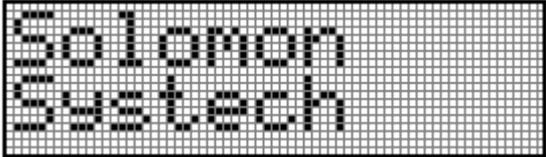

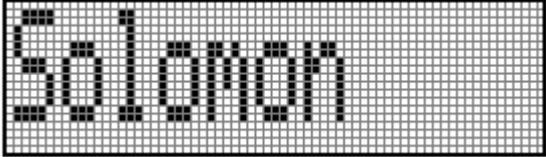

When NW = “High”, N bit is invalid, it means 4-line mode independent of N bit.

RE: Extended function registers enable bit

At this instruction, RE must be “Low”.

DH: When DH= “High”, UD2=1 and UD1=1 Double height font type control bit for 2 line mode:

**Table 9-6: Double Height display when DH=1, UD2=1 and UD1=1**

NW	N	DH	Display lines	Character font	Character Displays
			0	0	0
0	0	1	1	Forbidden	
0	1	0	2	5 x 8	
0	1	1	2	5 x 16	

When DH= “Low”, Double height font type control is disabled.

IS: Special registers enable bit

At this moment, IS must be “Low”.

### RE = 1

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	DL	N	BE	RE(1)	REV

DL: Interface data length control bit

When DL = “High”, it means 8-bit bus mode with MPU.

When DL = “Low”, it means 4-bit bus mode with MPU.

So to speak, DL is a signal to select 8-bit or 4-bit bus mode.

When 4-bit bus mode, it needs to transfer 4-bit data by two times.

- N: Display line number control bit  
 It is variable only when NW bit of extended function set instruction is low.  
 When N = “Low”, 1-line display mode (for NW=0), or 3-line display mode (for NW=1).  
 When N = “High”, 2-line display mode is set (for NW=0), or 4-line display mode (for NW=1).  
 When NW = “High”, N bit is invalid, it means 4-line mode independent of N bit.
- BE: CGRAM/SEGRAM data blink enable bit  
 If BE is “High”, It makes user font of CGRAM and segment of SEGRAM blink. The quantity of blink is assigned the highest 2 bit of CGRAM/SEGRAM.
- RE: Extended function registers enable bit  
 When RE = “High”, power down mode registers, extended function set registers, SEGRAM address set registers, BDC/ BDS bits, HS/DS bits of shift/scroll enable instruction and BE/ REV bits of function set register can be accessed.
- REV: Reverse enable bit  
 When REV = “High”, all the display data are reversed. Namely, all the white dots become black and black dots become white.  
 When REV = “Low”, the display mode set normal display.

### 9.12 Set CGRAM Address (IS = 0, RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0

Set CGRAM address to AC. This instruction makes CGRAM data available from MPU.

### 9.13 Set SEGRAM Address (IS = 1, RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	0	AC3	AC2	AC1	AC0

Set SEGRAM address to AC. This instruction makes SEGRAM data available from MPU.

### 9.14 Power/ Icon Control/ Contrast Set (IS = 1, RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	0	1	Ion	Bon	C5	C4

- Ion: Set ICON display on/off  
 When Ion = “High”, ICON display on.  
 When Ion = “Low”, ICON display off.
- Bon: Switch DCDC converter and regulator circuit  
 When Bon = “High”, DCDC converter and regulator circuit is turn on.  
 When Bon = “Low”, DCDC converter and regulator circuit is turn off.
- C5,C4 : Contrast set(high byte)  
 C5,C4,C3,C2,C1,C0 can more precisely adjust the input reference voltage of V0 generator. The details please refer to LCD driving voltage generator of block descriptions.

### 9.15 Follower Control (IS = 1, RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	1	0	Don	Rab2	Rab1	Rab0

Don: Switch divider circuit

When Don = “High”, internal divider circuit is turn on.

When Don = “Low”, internal divider circuit is turn off.

Rab2,Rab1,Rab0 : V0 generator internal resistor ratio

Rab2,Rab1,Rab0 can adjust the amplified ratio of V0 generator. The details please refer to LCD driving voltage generator of block descriptions.

**Table 9-7: Internal Resistor Ratio for LCD Driving Voltage**

	Rab2	Rab1	Rab0	1+Rb/Ra
IR7	1	1	1	6.5
IR6	1	1	0	5.3
IR5	1	0	1	4.4
IR4	1	0	0	3.6
IR3	0	1	1	3.0
IR2	0	1	0	2.6
IR1	0	0	1	2.2
IR0	0	0	0	1.9

### 9.16 Contrast Set (IS = 1, RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	1	1	C3	C2	C1	C0

C3,C2,C1,C0:Contrast set(low byte)

C5,C4,C3,C2,C1,C0 can more precisely adjust the input reference voltage of V0 generator. The details please refer to LCD driving voltage generator of block descriptions.

### 9.17 Set DDRAM Address (RE = 0)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0

Set DDRAM address to AC. This instruction makes DDRAM data available from MPU.

When 1-line display mode (N = 0, NW = 0), DDRAM address is from “00H” to “4FH”.

In 2-line display mode (N = 1, NW = 0), DDRAM address in the 1st line is from “00H” – “27H”, and DDRAM address in the 2nd line is from “40H” – “67H”.

In 3-line display mode (N=0, NW = 1), DDRAM address is from “00H” – “13H” in the 1st line, from “20H” to “33H” in the 2nd line and from “40H” – “53H” in the 3rd line.

In 4-line display mode (N=1, NW = 1), DDRAM address is from “00H” – “13H” in the 1st line, from “20H” to “33H” in the 2nd line, from “40H” – “53H” in the 3rd line and from “60H” – “73H” in the 4th line.

### 9.18 Set Scroll Quantity (RE = 1)

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	X	SQ5	SQ4	SQ3	SQ2	SQ1	SQ0

As set SQ5 to SQ0, horizontal scroll quantity can be controlled in dot units (Refer to Table 9-8). In this case SSD1803A can show hidden areas of DDRAM by executing smooth scroll from 1 to 48 dots.

**Table 9-8: Scroll Quantity According to HDS Bits**

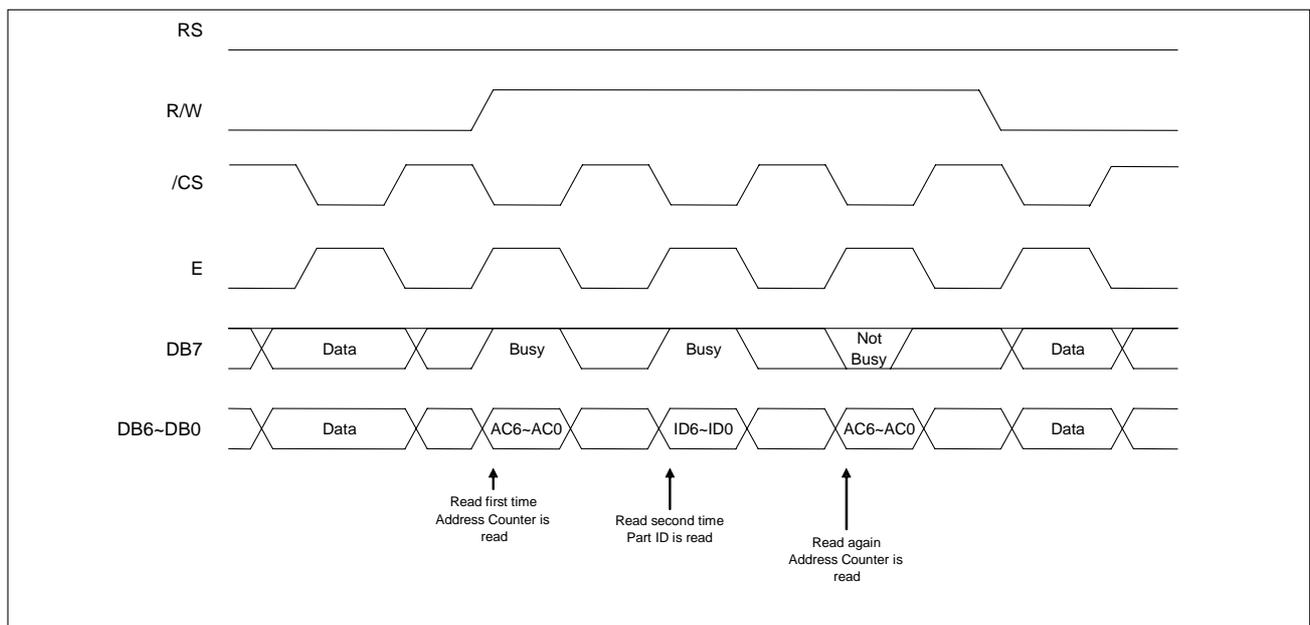

SQ5	SQ4	SQ3	SQ2	SQ1	SQ0	Function
0	0	0	0	0	0	No shift
0	0	0	0	0	1	Shift left by 1-dot
0	0	0	0	1	0	Shift left by 2-dot
0	0	0	0	1	1	Shift left by 3-dot
:	:	:	:	:	:	:
1	0	1	1	1	1	Shift left by 47-dot
1	1	X	X	X	X	Shift left by 48-dot

### 9.19 Read Busy Flag & Address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	1	BF	AC6/ID6	AC5/ID5	AC4/ID4	AC3/ID3	AC2/ID2	AC1/ID1	AC0/ID0

This instruction shows whether SSD1803A is in internal operation or not. If the resultant BF is High, it means the internal operation is in progress and you have to wait until BF to be Low, and then the next instruction can be performed. In this instruction you can read also the value of address counter or the part ID. When the first time the instruction is run, you can read the address counter. When the instruction is run the second time, you can read the part ID (refer to Figure 9-2).

**Figure 9-2: Read Busy Flag & Address/Part ID (6800 – parallel interface)**

<b>Part Number</b>	<b>Part ID</b>
SSD1803AM1V	0011010

## 9.20 Write Data to RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	D7	D6	D5	D4	D3	D2	D1	D0

Write binary 8-bit data to DDRAM/CGRAM/SEGRAM. The selection of RAM from DDRAM, CGRAM, or SEGRAM, is set by the previous address set instruction: DDRAM address set, CGRAM address set, SEGRAM address set. RAM set instruction can also determine the AC direction to RAM. After write operation, the address is automatically increased/ decreased by 1, according to the entry mode.

## 9.21 Read Data from RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	1	D7	D6	D5	D4	D3	D2	D1	D0

Read binary 8-bit data from DDRAM/CGRAM/SEGRAM. The selection of RAM is set by the previous address set instruction. If address set instruction of RAM is not performed before this instruction, the data that read first is invalid, because the direction of AC is not determined. If you read RAM data several times without RAM address set instruction before read operation, you can get correct RAM data from the second, but the first data would be incorrect, because there is no time margin to transfer RAM data. In case of DDRAM read operation, cursor shift instruction plays the same role as DDRAM address set instruction: it also transfer RAM data to output data register. After read operation address counter is automatically increased/decreased by 1 according to the entry mode. After CGRAM/SEGRAM read operation, display shift may not be executed correctly. In case of RAM write operation, after this AC is increased/decreased by 1 like read operation. In this time, AC indicates the next address position, but you can read only the previous data by read instruction.

In order to match the operating frequency of the GDDRAM with that of the MCU, some pipeline processing is internally performed which requires the insertion of a dummy read before the first actual display data read.

## 9.22 Extended Instruction Set

Extended instruction set includes a register selection and writing a data into the register. By writing temperature coefficient register, user can select one out of four TC settings. Similarly, by writing ROM selection register, user can select using ROMA, ROMB or ROMC by software settings.

## 10 MAXIMUM RATINGS

Table 10-1 Maximum Ratings (Voltage Referenced to VSS)

Symbol	Parameter	Value	Unit
V <sub>DDIO</sub>	Power Supply Voltage	-0.3 to 6.0	V
V <sub>DD</sub>		-0.3 to 6.0	
V <sub>CI</sub>		-0.3 to 6.0	
V <sub>LCD</sub>		-0.3 to 15.0	V
V <sub>IN</sub>	Input Voltage	-0.3 to V <sub>DD</sub> + 0.3	V
T <sub>A</sub>	Operating Temperature	-40 to 85	°C
T <sub>STG</sub>	Storage Temperature	-55 to 125	°C

Voltage greater than above may damage to the circuit ( $V_0 \geq V_1 \geq V_4 \geq V_3 \geq V_4 \geq VSS$ )

Maximum ratings are those values beyond which damages to the device may occur. Functional operation should be restricted to the limits in the Electrical Characteristics tables or Pin Description section

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit. Reliability of operation is enhanced if unused input is connected to an appropriate logic voltage level (e.g., either V<sub>SS</sub> or V<sub>DDIO</sub>). Unused outputs must be left open. This device may be light sensitive. Caution should be taken to avoid exposure of this device to any light source during normal operation. This device is not radiation protected.

## 11 DC CHARACTERISTICS

### Conditions (Unless Otherwise Specified):

Voltage referenced to  $V_{SS}$

$V_{DD} = 2.4$  to  $3.6V$

$T_A = -40$  to  $85^\circ C$

**Table 11-1: DC Characteristics**

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit	
$V_{DDIO}$	Operating Voltage	Low Voltage I/O Application	2.4	3	VCI	V	
		5V I/O Application	4.5	5	5.5	V	
$V_{DD}$	Operating Voltage	Low Voltage I/O Application	2.4	3	3.6	V	
		5V I/O Application (VDD as output)	-	-	-	V	
$V_{CI}$	Operating Voltage	-	VDD	VDD	VDD	V	
$I_{DD}$	Supply Current	Internal oscillation ( $V_{DD} = 3.0V$ , $f_{OSC} = 540kHz$ )	-	0.3	0.55	mA

$$TC(\%) = \frac{V_{ref} \text{ at } 50^\circ C - V_{ref} \text{ at } 0^\circ C}{50^\circ C - 0^\circ C} \times \frac{1}{V_{ref} \text{ at } 25^\circ C} \times 100\%$$

## 12 AC CHARACTERISTICS

### Conditions (Unless Otherwise Specified):

Voltage referenced to  $V_{SS}$

$V_{DD} = 2.4$  to  $3.6V$

$T_A = -40$  to  $85^\circ C$

**Table 12-1: Oscillator Frequency**

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
$F_{OSC}^{(1)}$	Oscillator frequency	$V_{DD} = 2.4$ to $3.6V$ $T_A = -40$ to $85^\circ C$	480	540	600	kHz

**Table 12-2: Frame Frequency in Different Line Mode**

Display Mode	Duty Cycle	Line Period (clocks)		Frame Frequency (Hz)	
		5-dot	6-dot	5-dot	6-dot
1-line display mode	1/9	370	440	81	68
2-line display mode	1/17	200	240	79	66
3-line display mode	1/25	130	160	83	68
4-line display mode	1/33	100	120	82	68

### Note

<sup>(1)</sup>  $F_{OSC}$  stands for the frequency value of the internal oscillator.

## 12.1 CPU Interface Timing

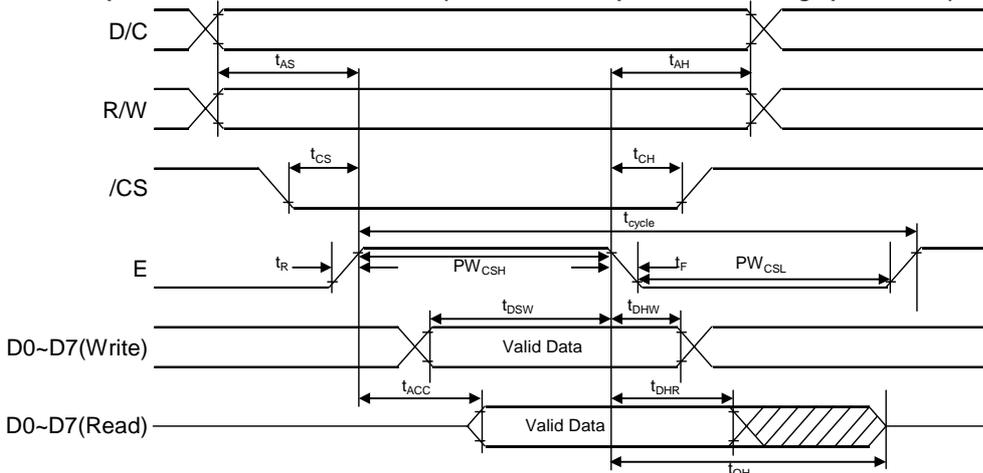

### 12.1.1 Parallel 6800-series Interface Timing

Table 12-3: Parallel Timing Characteristics (TA = -40 to 85 ° C, VDDIO = 2.4-3.6/ 4.5-5.5V, VSS =0V)

Symbol	Parameter	Min	Typ	Max	Unit
$t_{cycle}$	Clock Cycle Time (write cycle)	400	-	-	ns
$t_{AS}$	Address Setup Time	13	-	-	ns
$t_{AH}$	Address Hold Time	17	-	-	ns
$t_{CS}$	Chip Select Time	0	-	-	ns
$t_{CH}$	Chip Select Hold Time	0	-	-	ns
$t_{DSW}$	Write Data Setup Time	35	-	-	ns

t <sub>HD</sub>	Data Hold Time (for “SDA <sub>OUT</sub> ” pin)	0	-	-	ns
	Data Hold Time (for “SDA <sub>IN</sub> ” pin)	300	-	-	ns
t <sub>SD</sub>	Data Setup Time	100	-	-	ns
t <sub>SSTART</sub>	Start condition Setup Time (Only relevant for a repeated Start condition)	0.6	-	-	us
t <sub>SSTOP</sub>	Stop condition Setup Time	0.6	-	-	us
t <sub>R</sub>	Rise Time for data and clock pin	-	-	300	ns
t <sub>F</sub>	Fall Time for data and clock pin	-	-	300	ns
t <sub>IDLE</sub>	Idle Time before a new transmission can start	1.3	-	-	us

Note: All timings are based on 20% to 80% of V<sub>DDIO</sub>-V<sub>SS</sub>

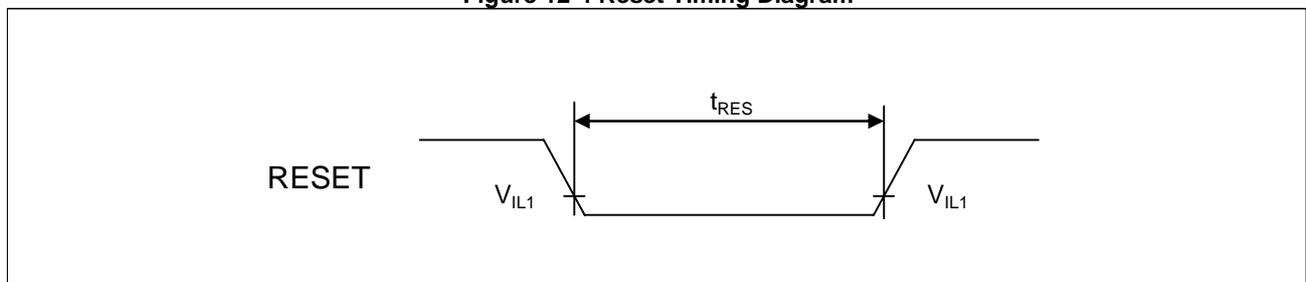

**Figure 12-3 : I2C Timing Characteristics (IM2 = L, IM1 = H)**

**Table 12-6: Reset Timing (TA = -40 to 85° C, VDD = 2.4-3.6, VSS =0V)**

Item	Symbol	Min	Typ	Max	Unit
Reset Low level (refer to figure 12-4)	t <sub>RES</sub>	20	-	-	us

**Figure 12-4 Reset Timing Diagram**

### 13 APPLICATION EXAMPLES

#### 13.1 Application Example I (I2C interface, 3-line display, 3V VDDIO mode)

Figure 13-1: Block Diagram of Application Example I

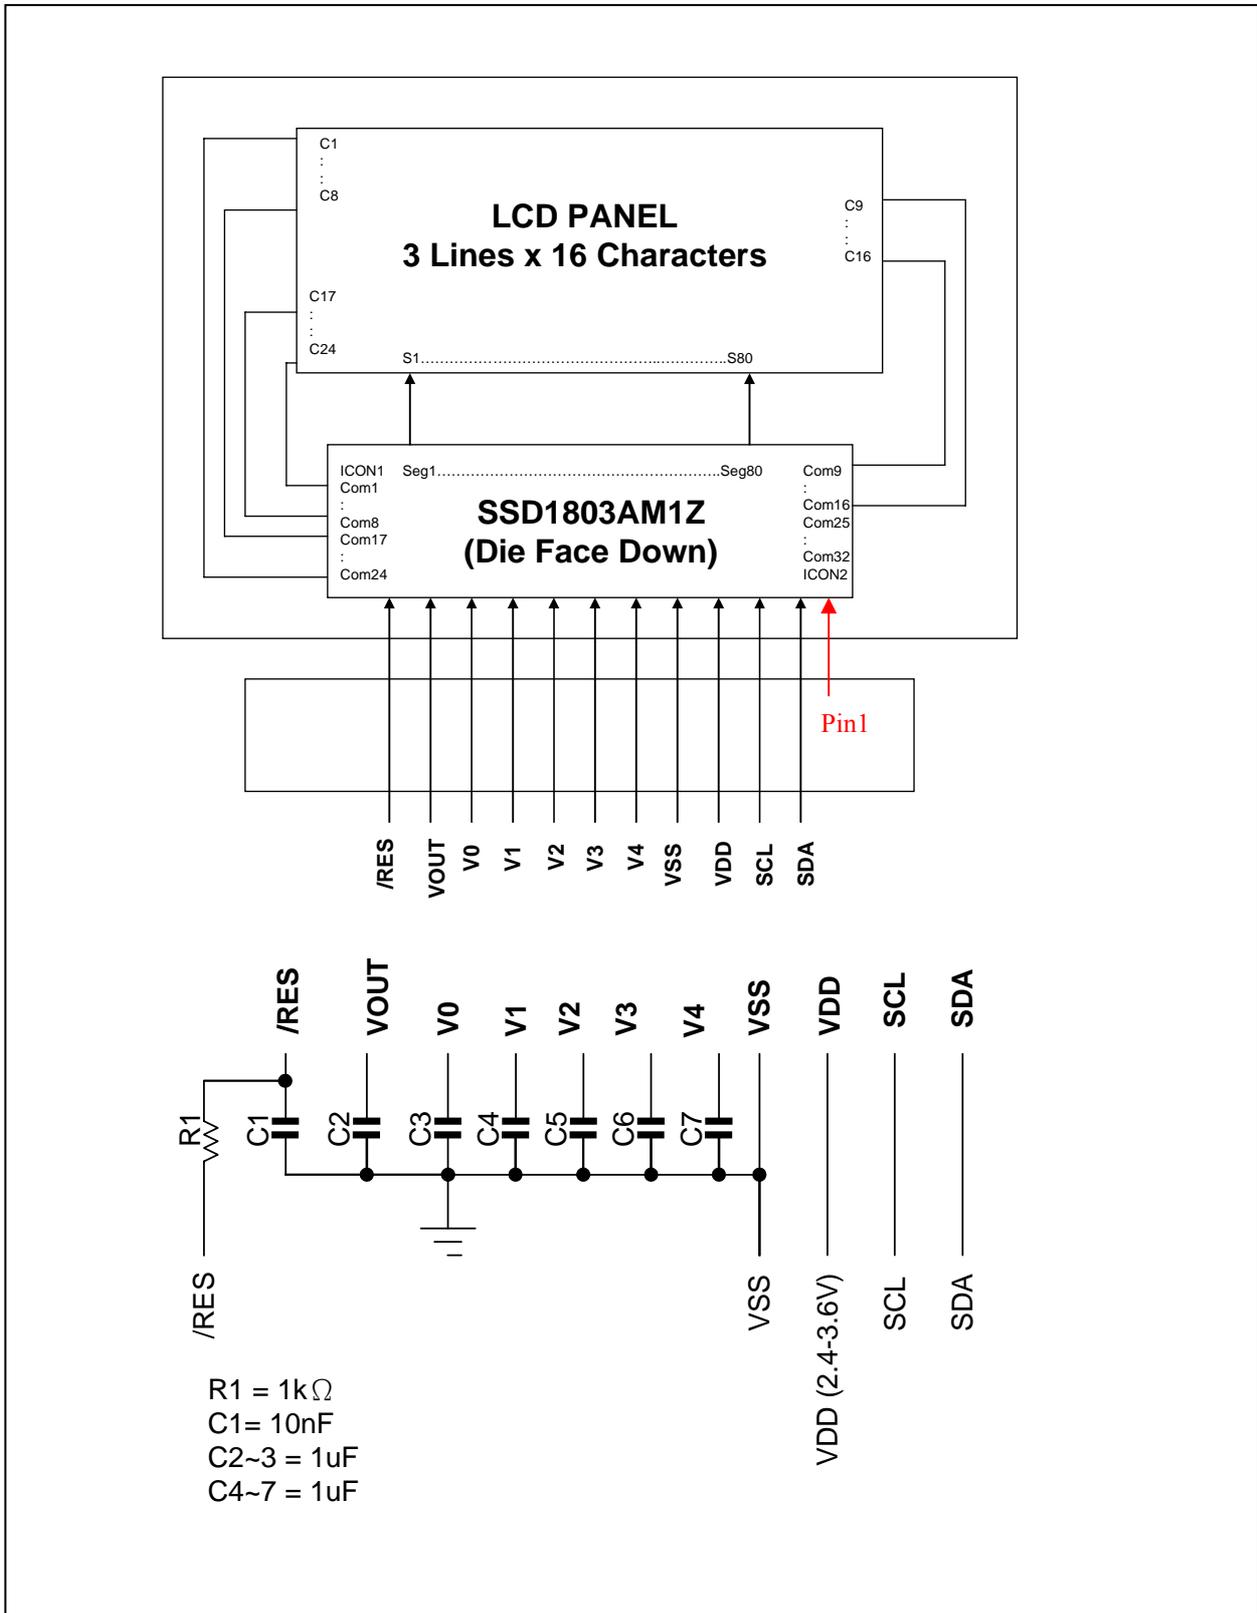

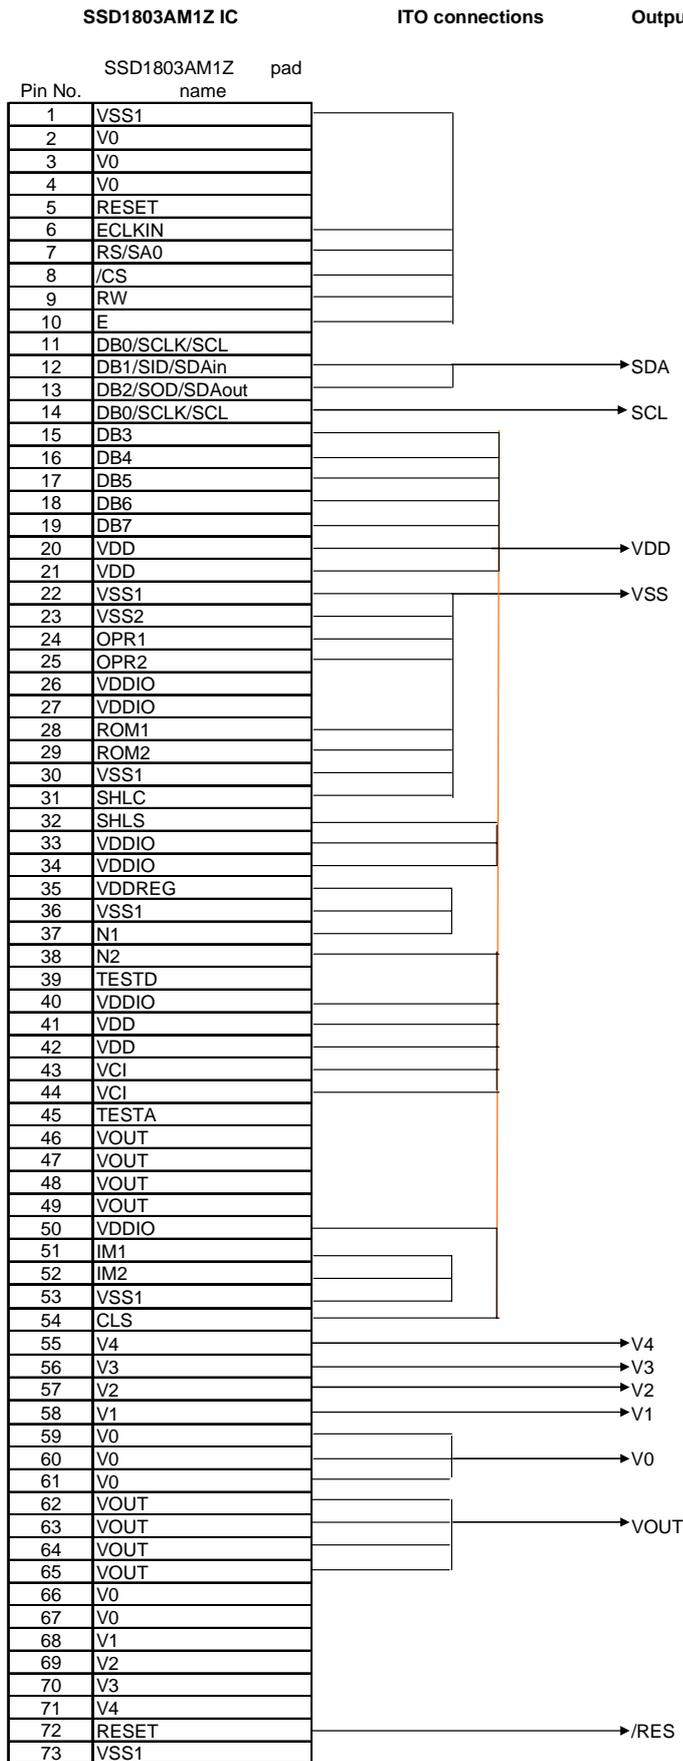

Figure 13-2: Pin Connections of Application Example I

## 13.2 Application Example II (4-line display, 5V IO mode)

Figure 13-3: Block Diagram of Application Example II

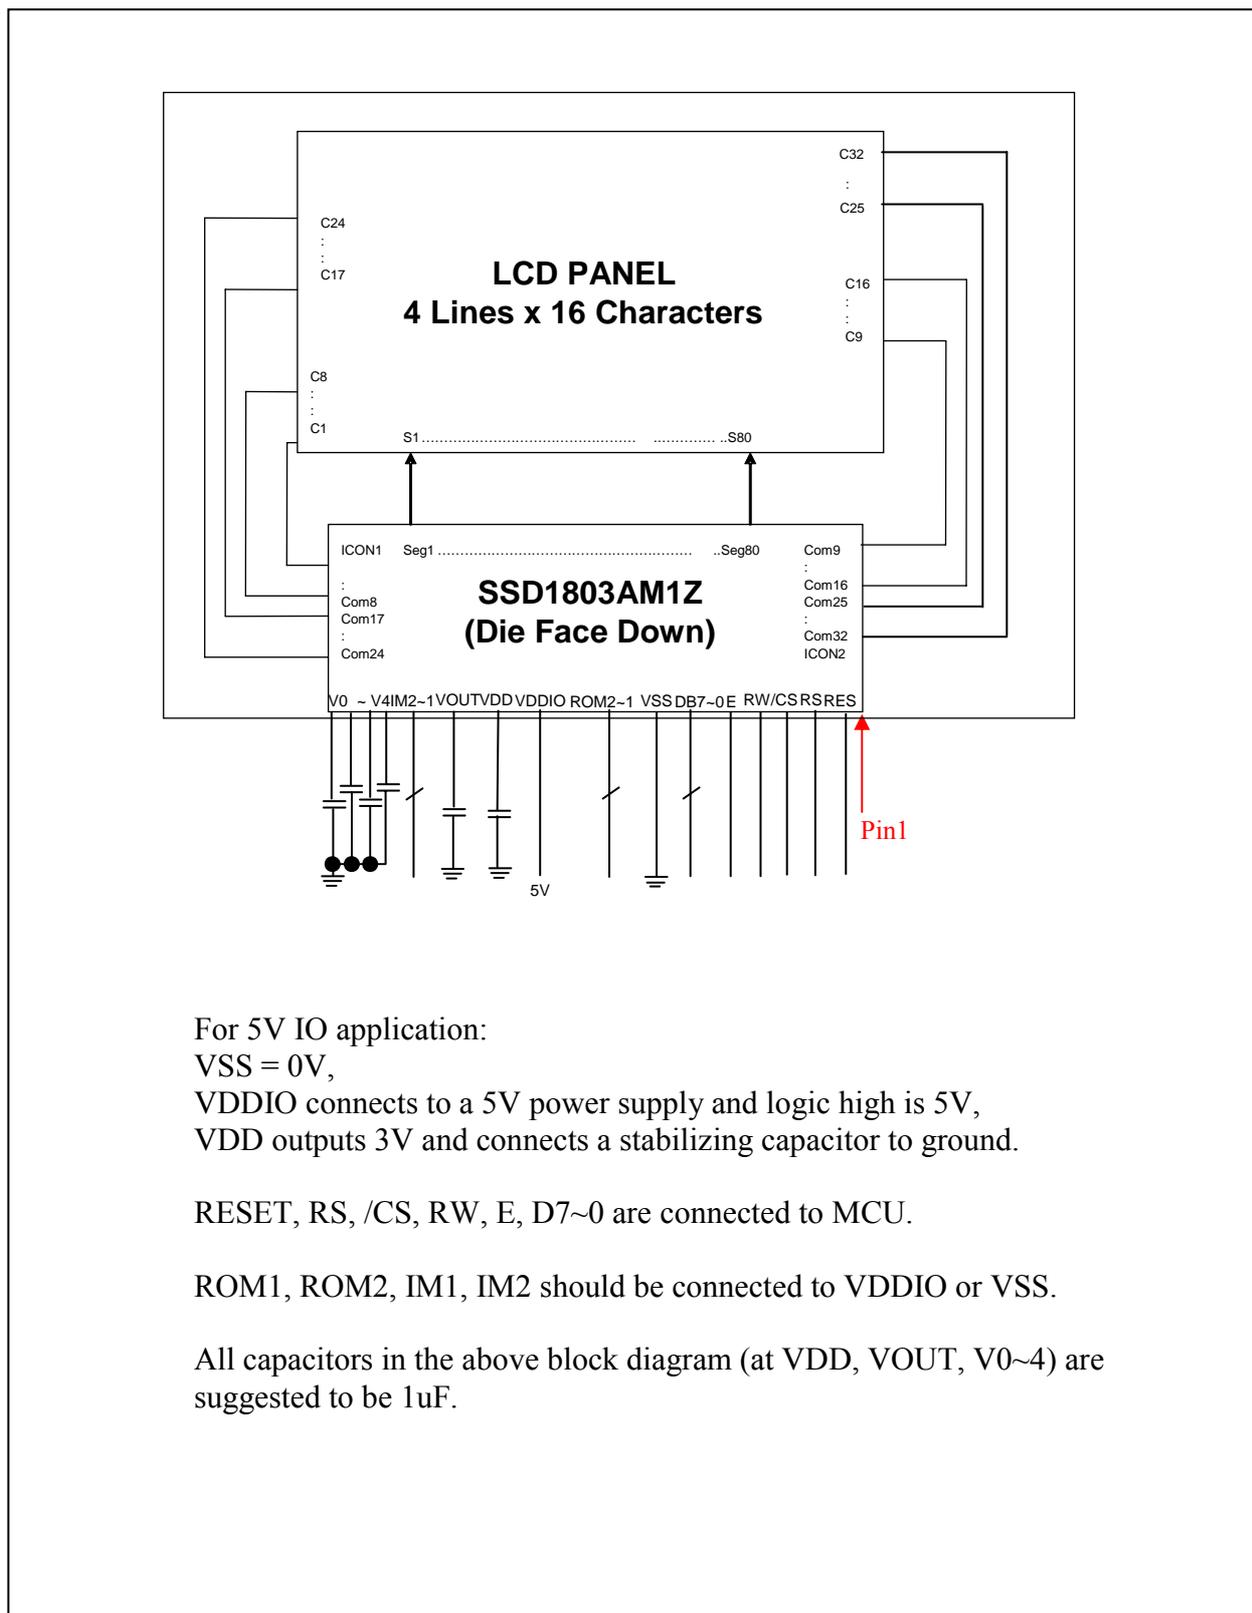

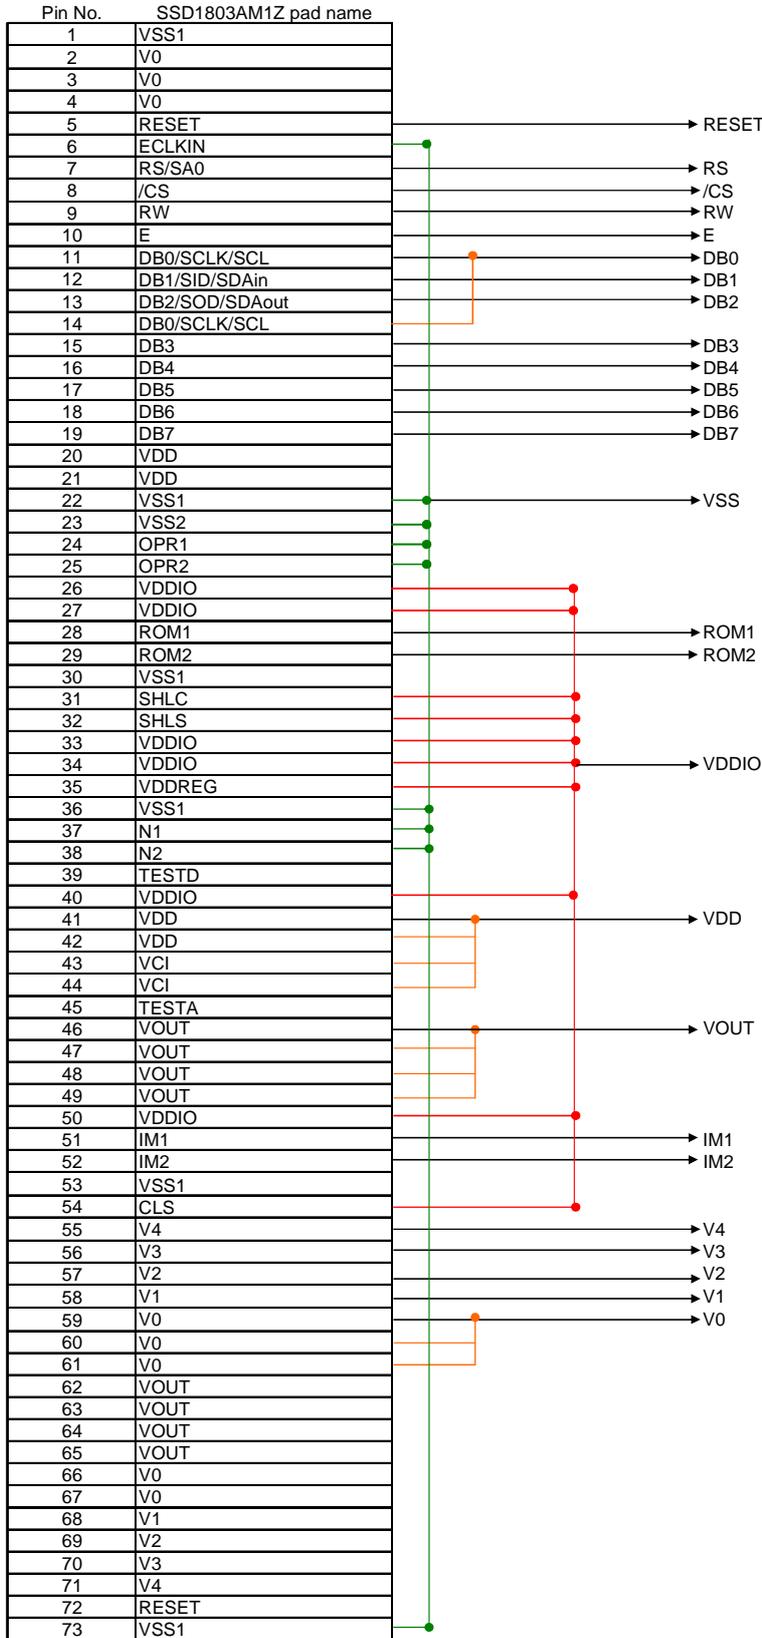

Figure 13-4: Pin Connections of Application Example II

SSD1803AM1Z IC

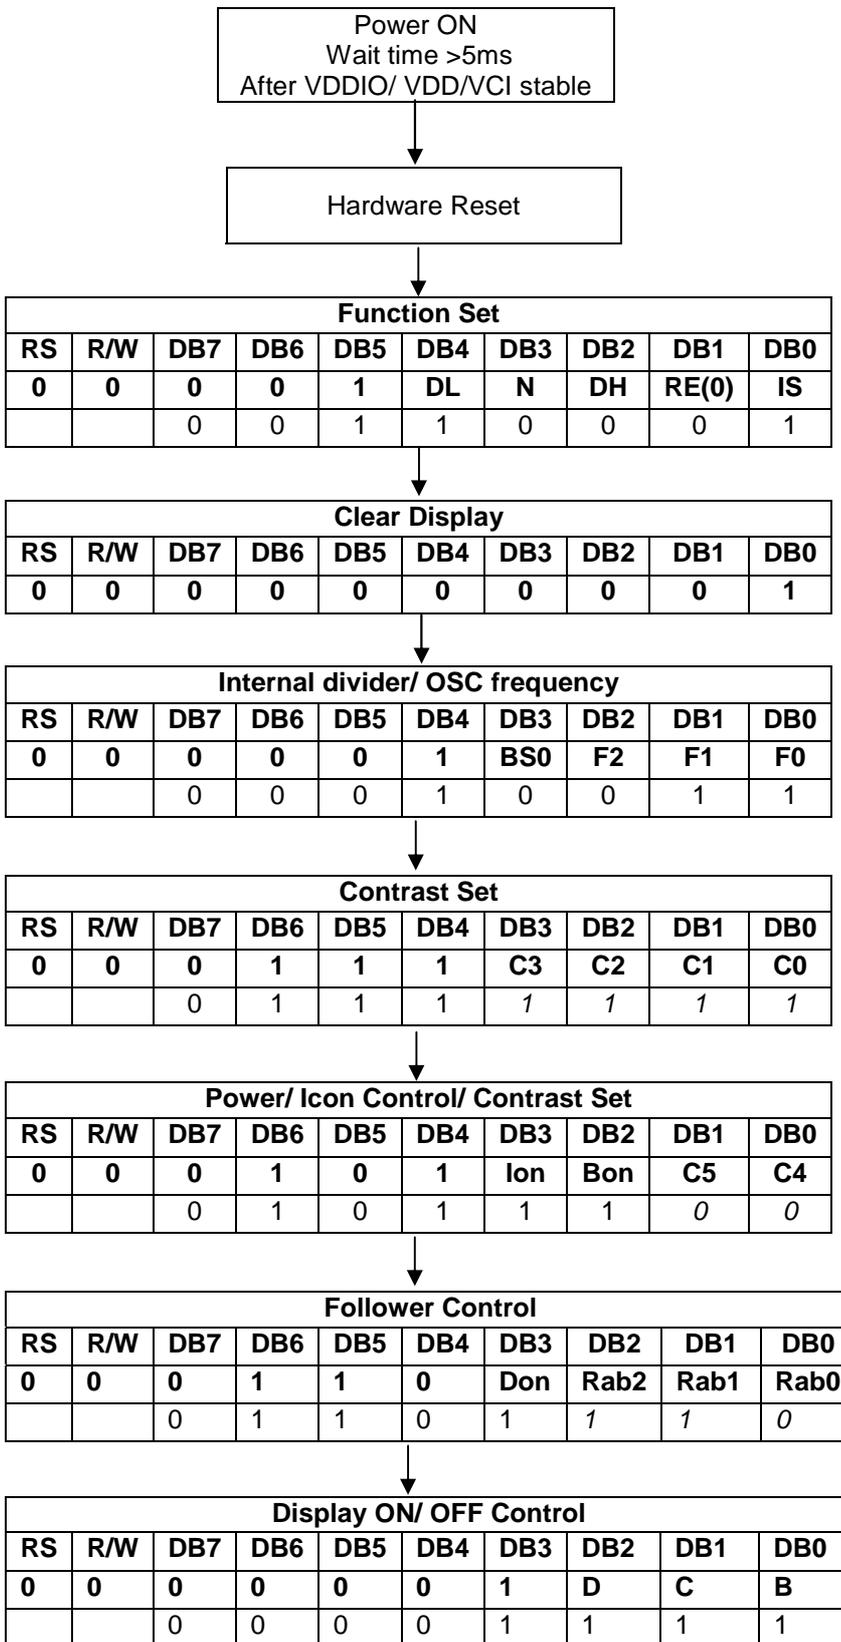

ITO connections

Output pins

### 13.3 Initialization

Figure 13-5: Initialization Code Example

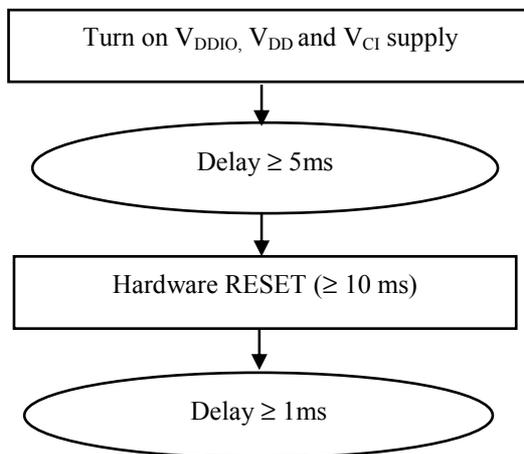

\*C5~0 and Rab2~0 setting depends on actual panel loadings and application

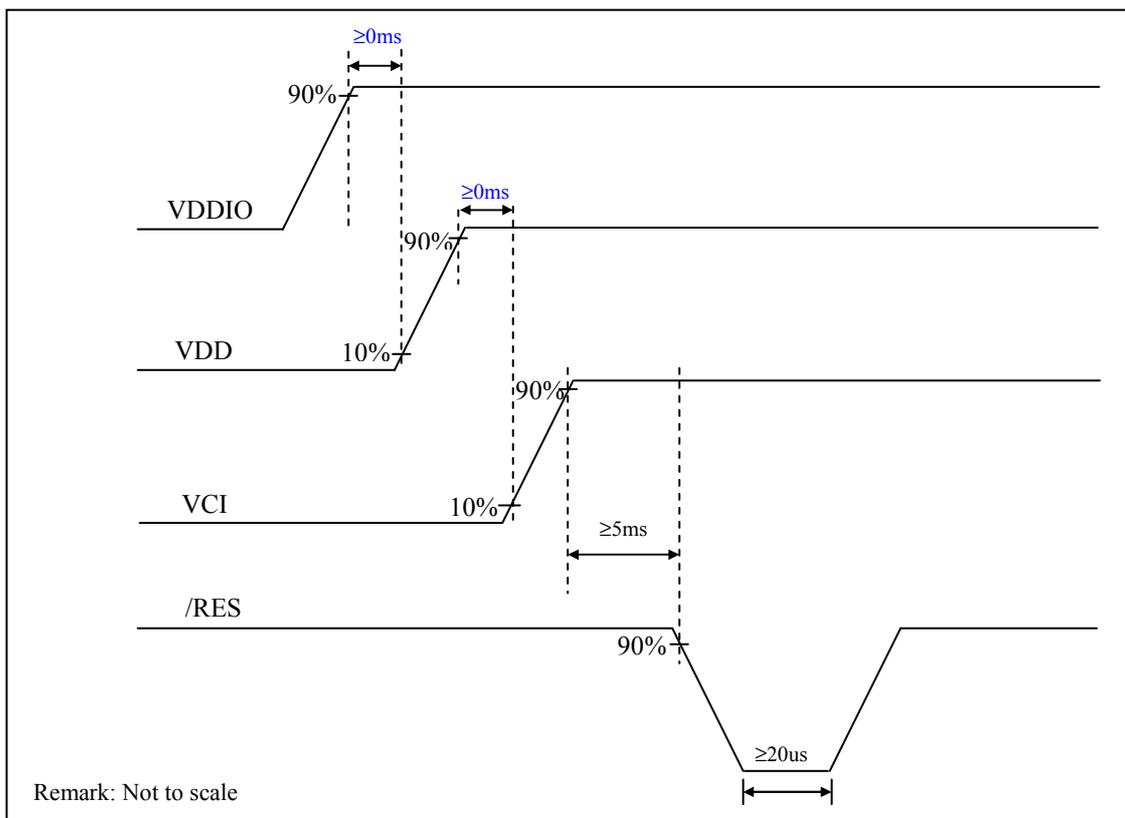

### 13.4 Power On/Off Sequence & Vout Timing

Note: To prevent potential damage to the device, all capacitors must be discharged to below 0.5V before the driver is removed from, or before the driver is attached to those components.

**Figure 13-6: Power On Sequence**

**Figure 13-7: Power Up Sequence (if VDDIO, VDD and VCI not shorted together)**

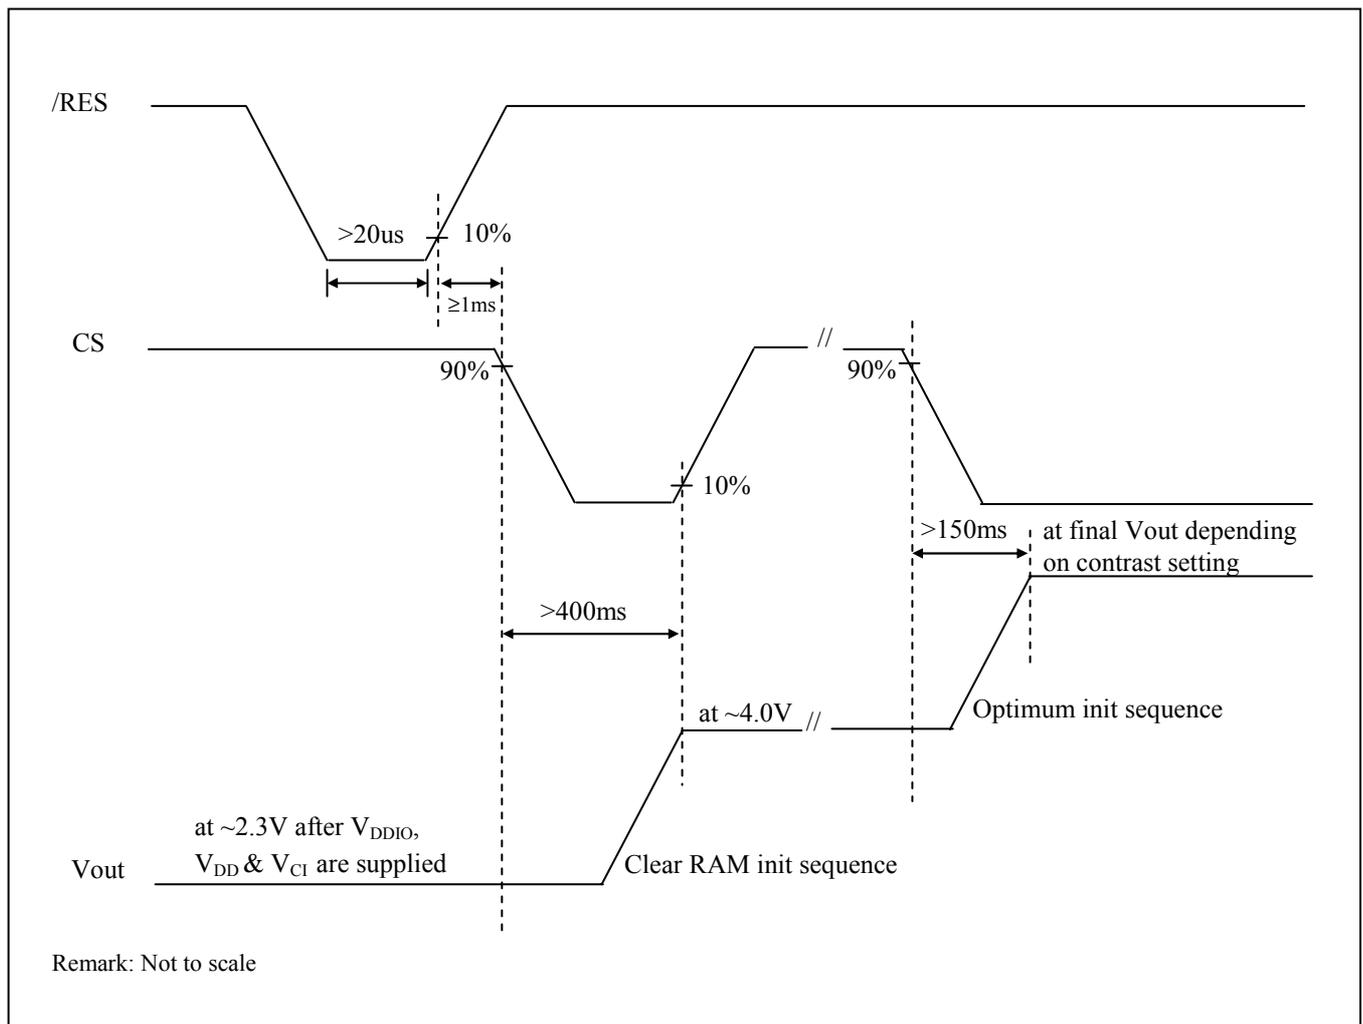

**Recommended enter power save mode (sleep mode) Sequence:**

1. Display off (Set DB2 = 0 in Display On/Off control)
2. Enter sleep mode (Set DB1 = 1 in Power down mode)

**Recommended leave power save Sequence:**

1. Leave sleep mode (Set DB1 = 0 in Power down mode)
2. Display On (Set DB2 = 1 in Display On/Off control)

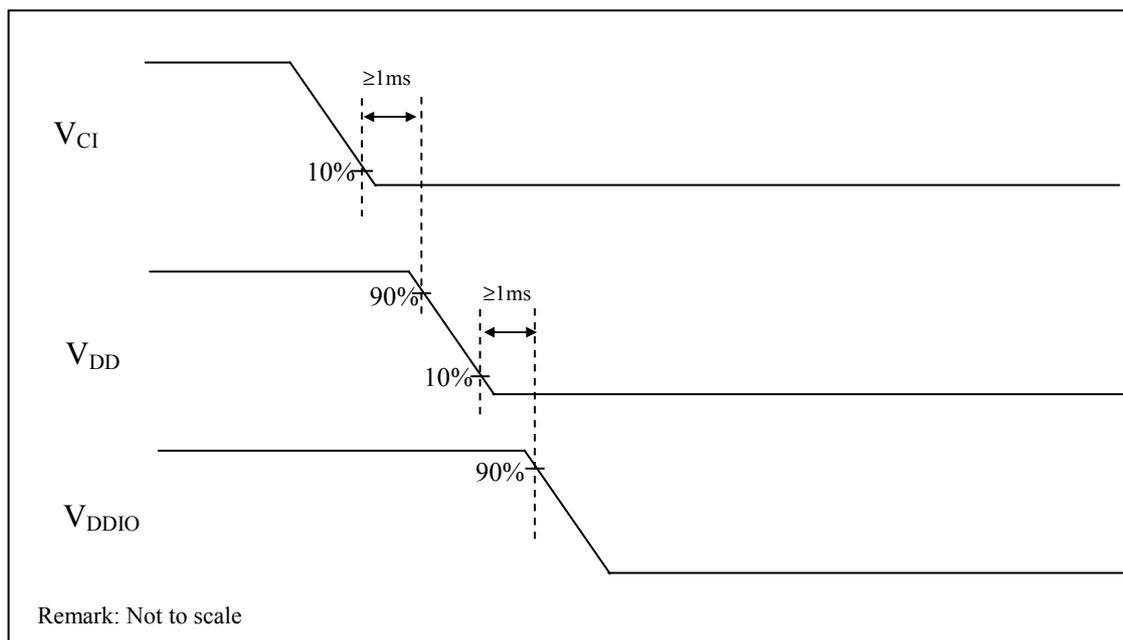

Figure 13-8: Vout Timing Diagram

### Recommended Power Off Sequence:

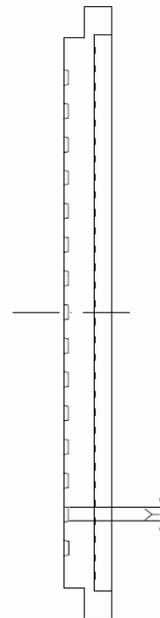

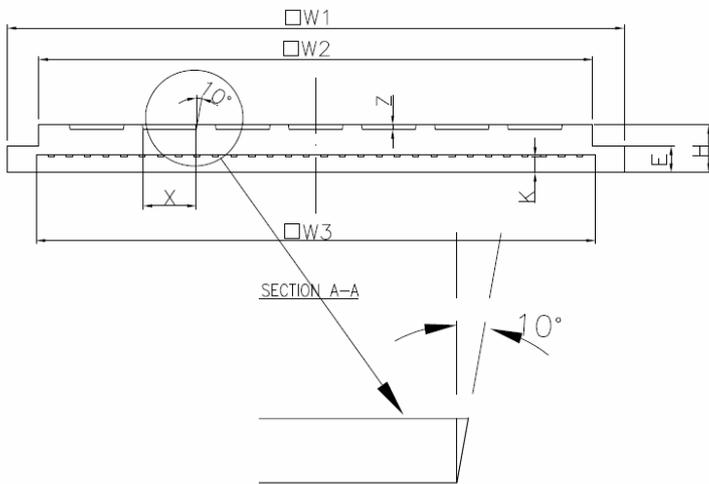

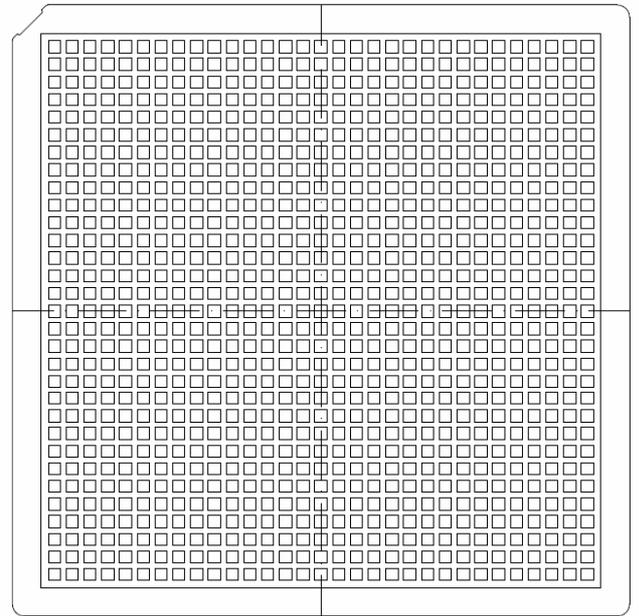

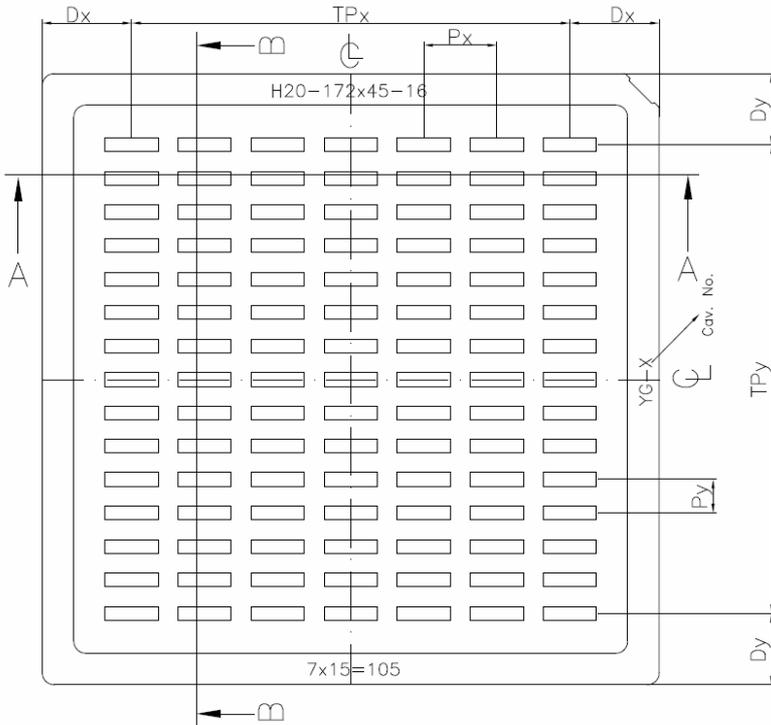

1. Drop the contrast & gain (Set DB2~0 = 0 in Power/ Icon control/ Contrast Set)  
(Set DB2~0 = 0 in Follower Control)  
(Set DB3~0 = 0 in Contrast Set)
2. Delay  $\geq 25\text{ms}$
3. Display off (Set DB2 = 0 in Display On/Off control)
4. Delay  $\geq 1\text{ms}$
5. Enter sleep mode (Set DB1 = 1 in Power down mode)
6. Delay  $\geq 1\text{ms}$
7. Power off  $V_{\text{DDIO}}$ ,  $V_{\text{DD}}$  and  $V_{\text{CI}}$  supplies  
( $V_{\text{CI}} \rightarrow V_{\text{DD}} \rightarrow V_{\text{DDIO}}$  if they are not shorted together)

**Figure 13-9: Power Down Sequence (if VDDIO, VDD and VCI not shorted together)**

Solomon Systech reserves the right to make changes without notice to any products herein. Solomon Systech makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Solomon Systech assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any, and all, liability, including without limitation consequential or incidental damages. “Typical” parameters can and do vary in different applications. All operating parameters, including “Typical” must be validated for each customer application by the customer’s technical experts. Solomon Systech does not convey any license under its patent rights nor the rights of others. Solomon Systech products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Solomon Systech product could create a situation where personal injury or death may occur. Should Buyer purchase or use Solomon Systech products for any such unintended or unauthorized application, Buyer shall indemnify and hold Solomon Systech and its offices, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Solomon Systech was negligent regarding the design or manufacture of the part.

The product(s) listed in this datasheet comply with Directive 2002/95/EC of the European Parliament and of the council of 27 January 2004 on the restriction of the use of certain hazardous substances in electrical and electronic equipment and People’s Republic of China Electronic Industry Standard SJ/T 11363-2006 “Requirements for concentration limits for certain hazardous substances in electronic information products (电子信息产品中有毒有害物质的限量要求)”. Hazardous Substances test report is available upon request.
